Dynamic Habitats

Local scale - Monterey Bay

Cetaceans in the MBNMS

- **Who are they?**
 - Migratory whales
 - Cold-temperate, wide-ranging
 - Warm-temperate, wide-ranging
 - Coastal populations
 - Deep ocean species
- **How are they doing?**
 - Past exploitation
 - Current population trends
 - Emerging issues
- **What do we still need to learn?**
 - Some ongoing studies in MBNMS

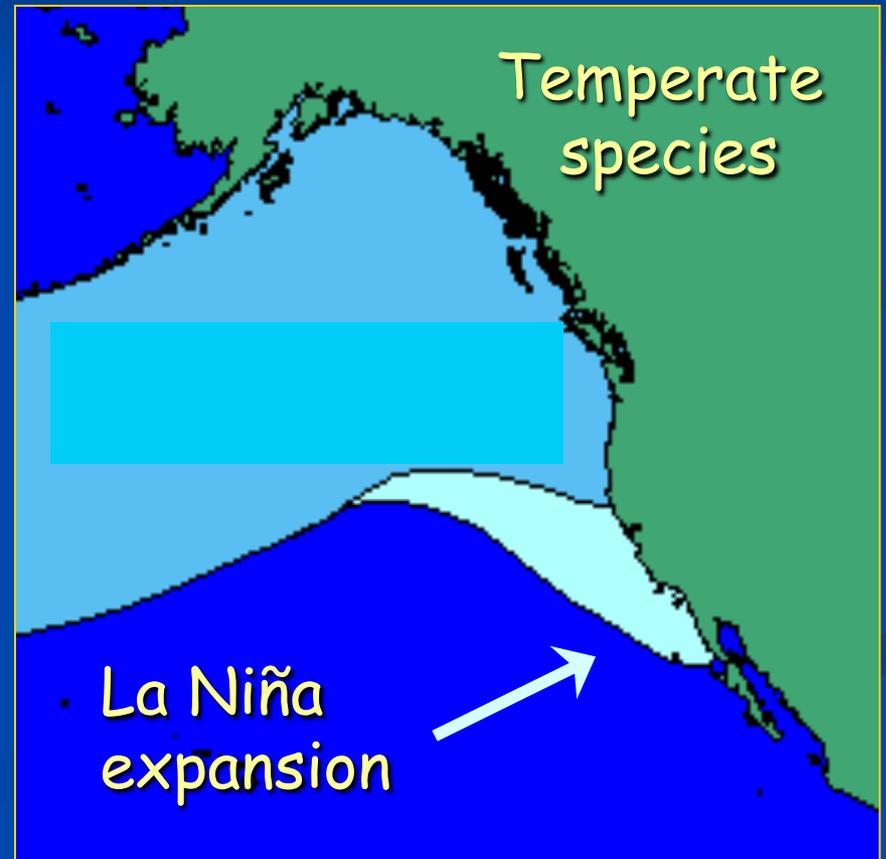

Great diversity of Cetaceans within the MBNMS

<u>Taxonomic Group</u>	<u># Species</u>
Mysticetes (baleen whales)	6
Delphinids (dolphins)	8
Phocoenids (porpoises)	2
Ziphiids (beaked whales)	8
Physeterids (sperm whales)	3
TOTAL	27

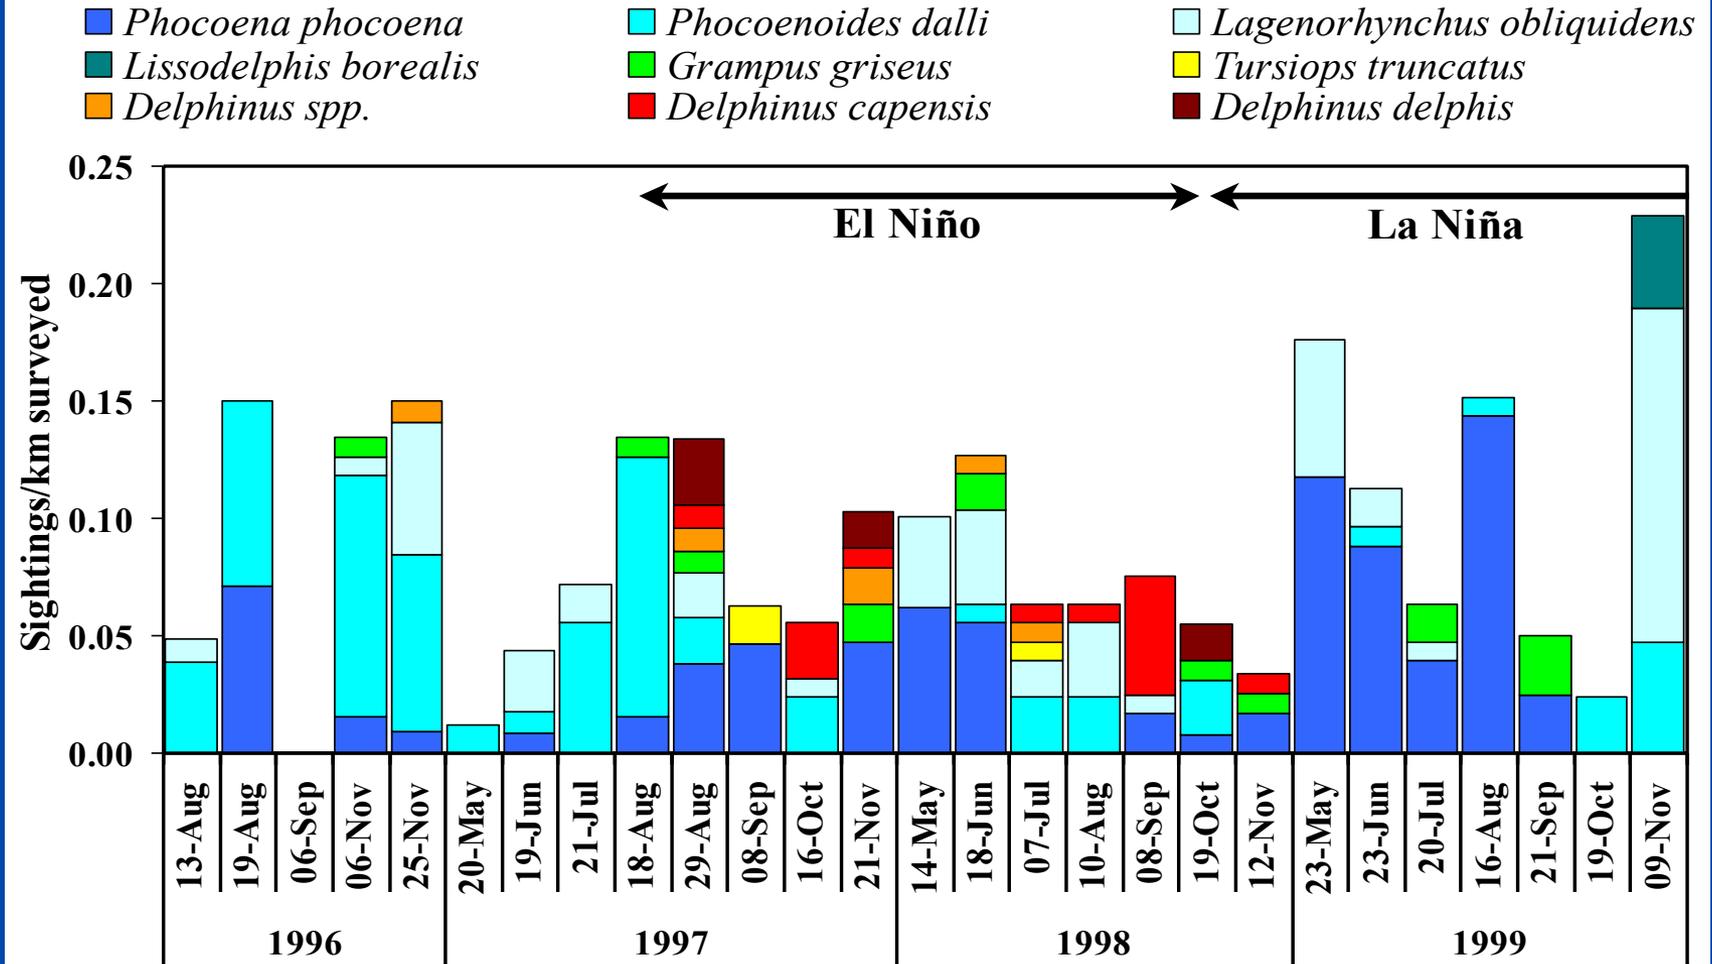

Nearly 1/3 of all cetacean species worldwide

Odontocete Assemblage in Monterey Bay

Benson et al. 2002 (Progress in Oceanography)

Life history traits

- **Long-lived species (10 - 100+ yrs)**
 - Low population growth rates
 - High adult survival
 - Late age at sexual maturity
 - Single offspring every 1-5 years
 - Long recovery times following impacts (e.g. hunting, bycatch)
- **Highly social**
- **Adapted to dynamic environment**
 - Highly mobile to exploit ephemeral prey resources
- **Many species widely distributed, but often with discrete populations**

Risks vary by species and region...

Incidental fishery bycatch

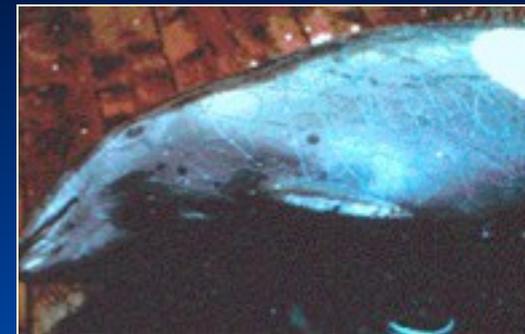

Ship strikes

Pollution and HABs

Illegal shooting

Naval/seismic exercises

Other...

**How do we study and
monitor cetacean populations?**

Common methods of monitoring marine mammal populations

Shipboard line-transect surveys

Aerial line-transect surveys and photography

Small boat based photo-identification studies

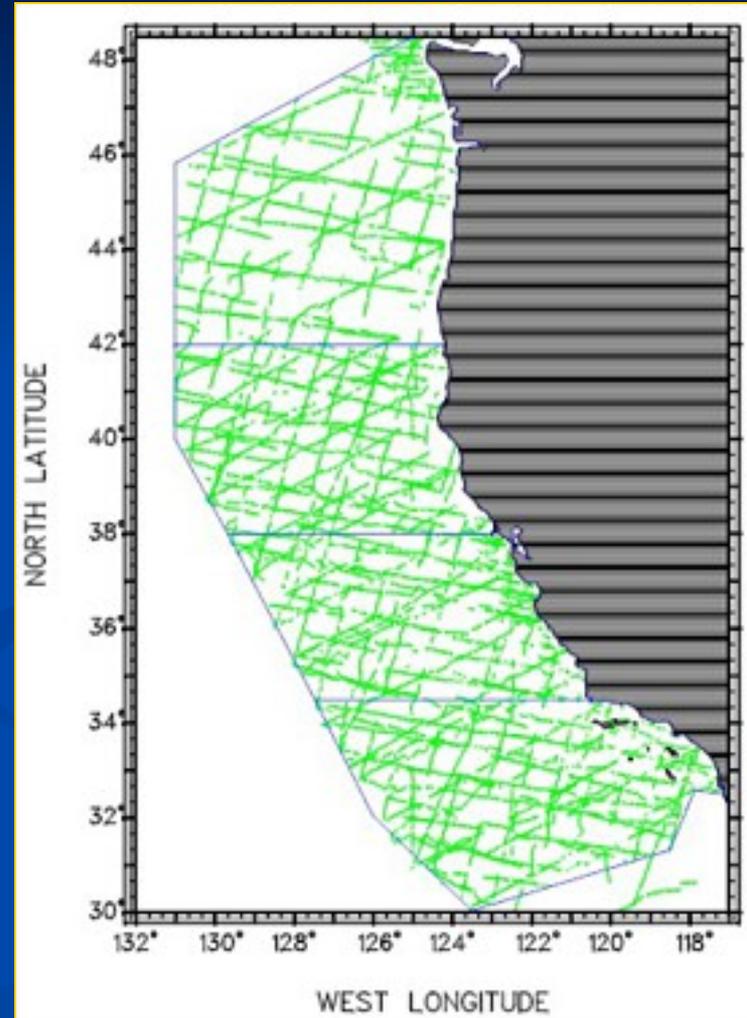

SWFSC West Coast Shipboard Surveys

Cetacean surveys,
summer & fall
1991, 1993, 1996,
2001, 2005, 2008

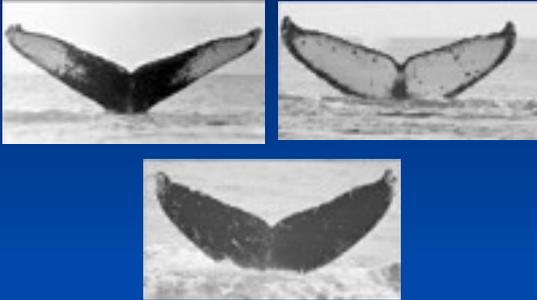

Systematic line-transect methods
Use line-transect analyses to estimate
abundance of all cetacean species

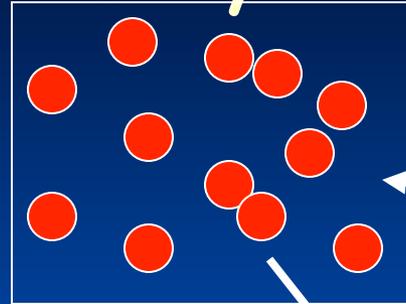

Completed transect
lines 1991-2005

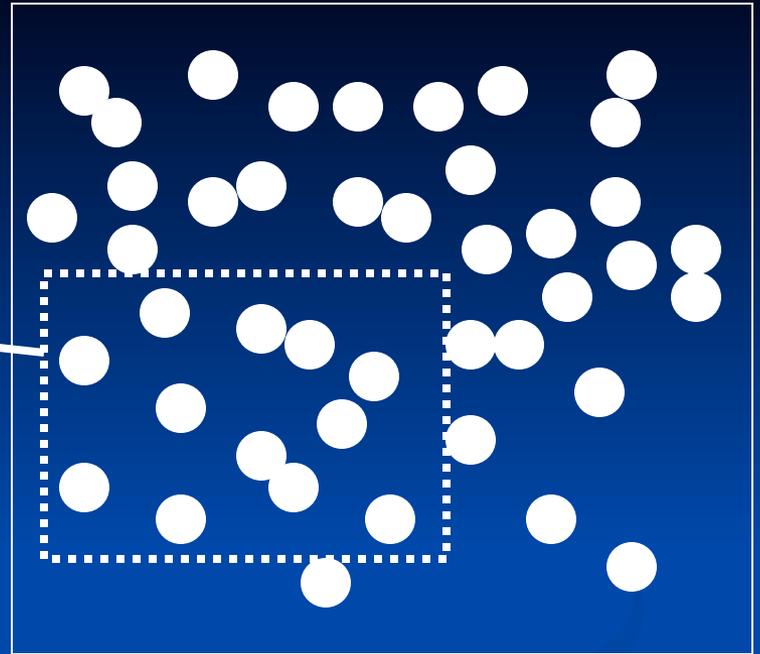

Mark Recapture

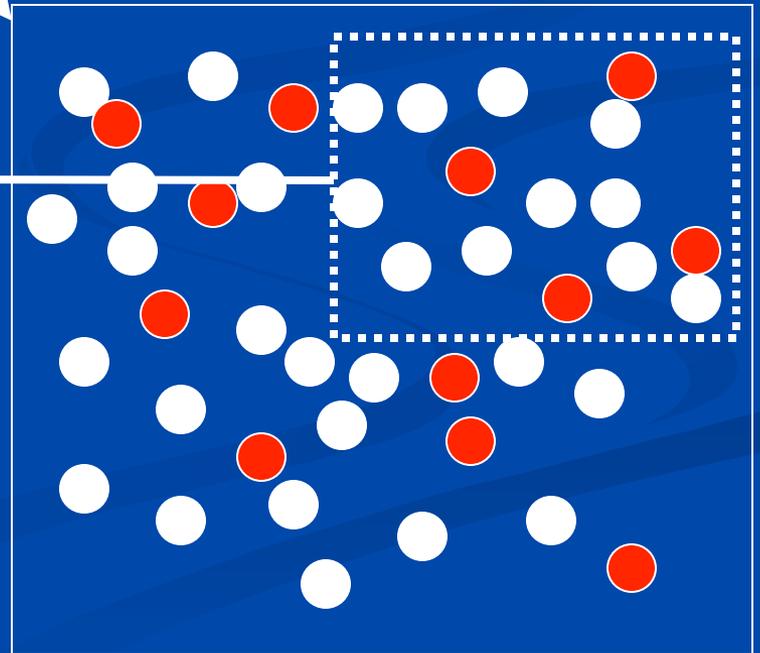

Survey 1:

$M = \text{marked}$

Survey 2:

$$N = \frac{M * C}{R}$$

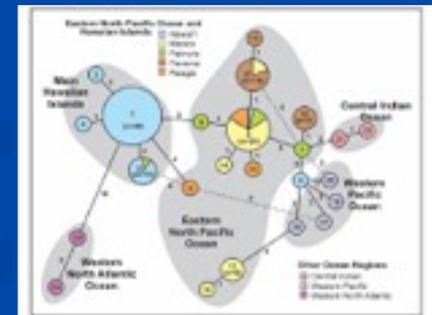

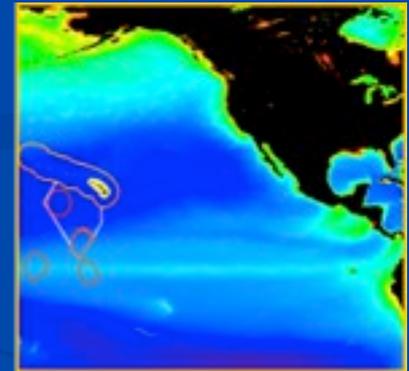

$$45 = \frac{12 * 15}{4}$$

$C = \text{captured}$

$R = \text{recaptured}$

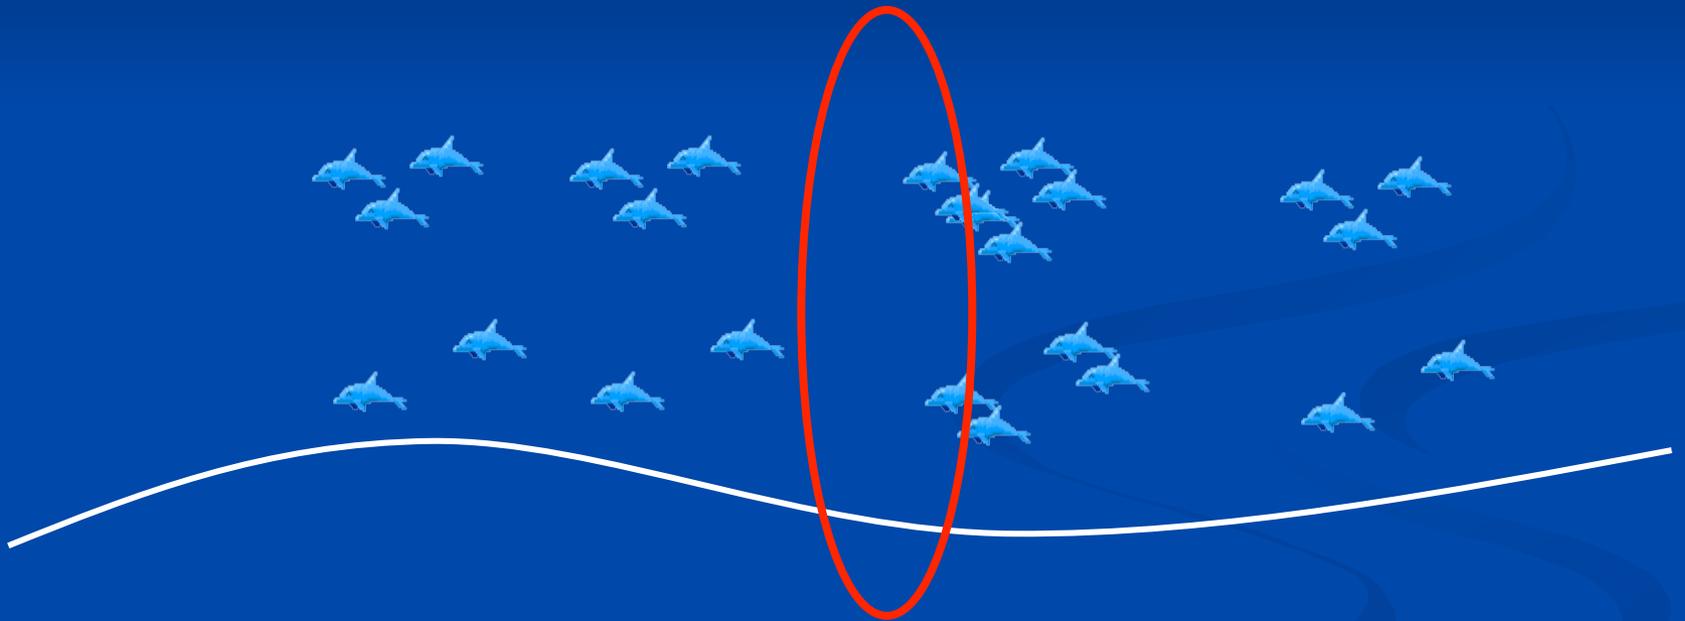

Stock identification tools

- Distribution
- Movements (photo, tagging)
- Population trends
- Genetic differences
- Morphological differences
- Life history
- Contaminant loads
- Natural isotope ratios
- Parasite differences
- Habitat differences

Importance of recognizing local populations

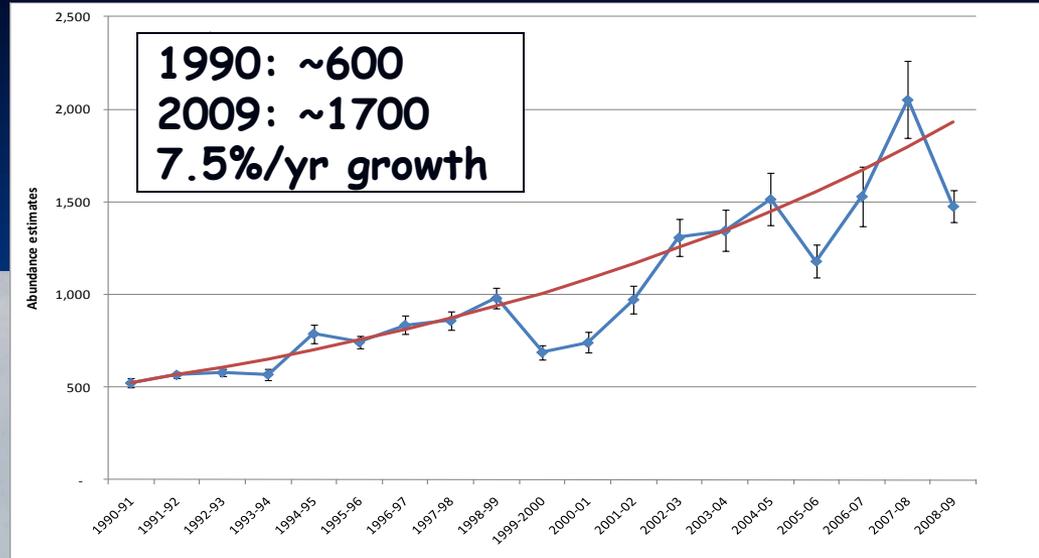

Adverse Impact

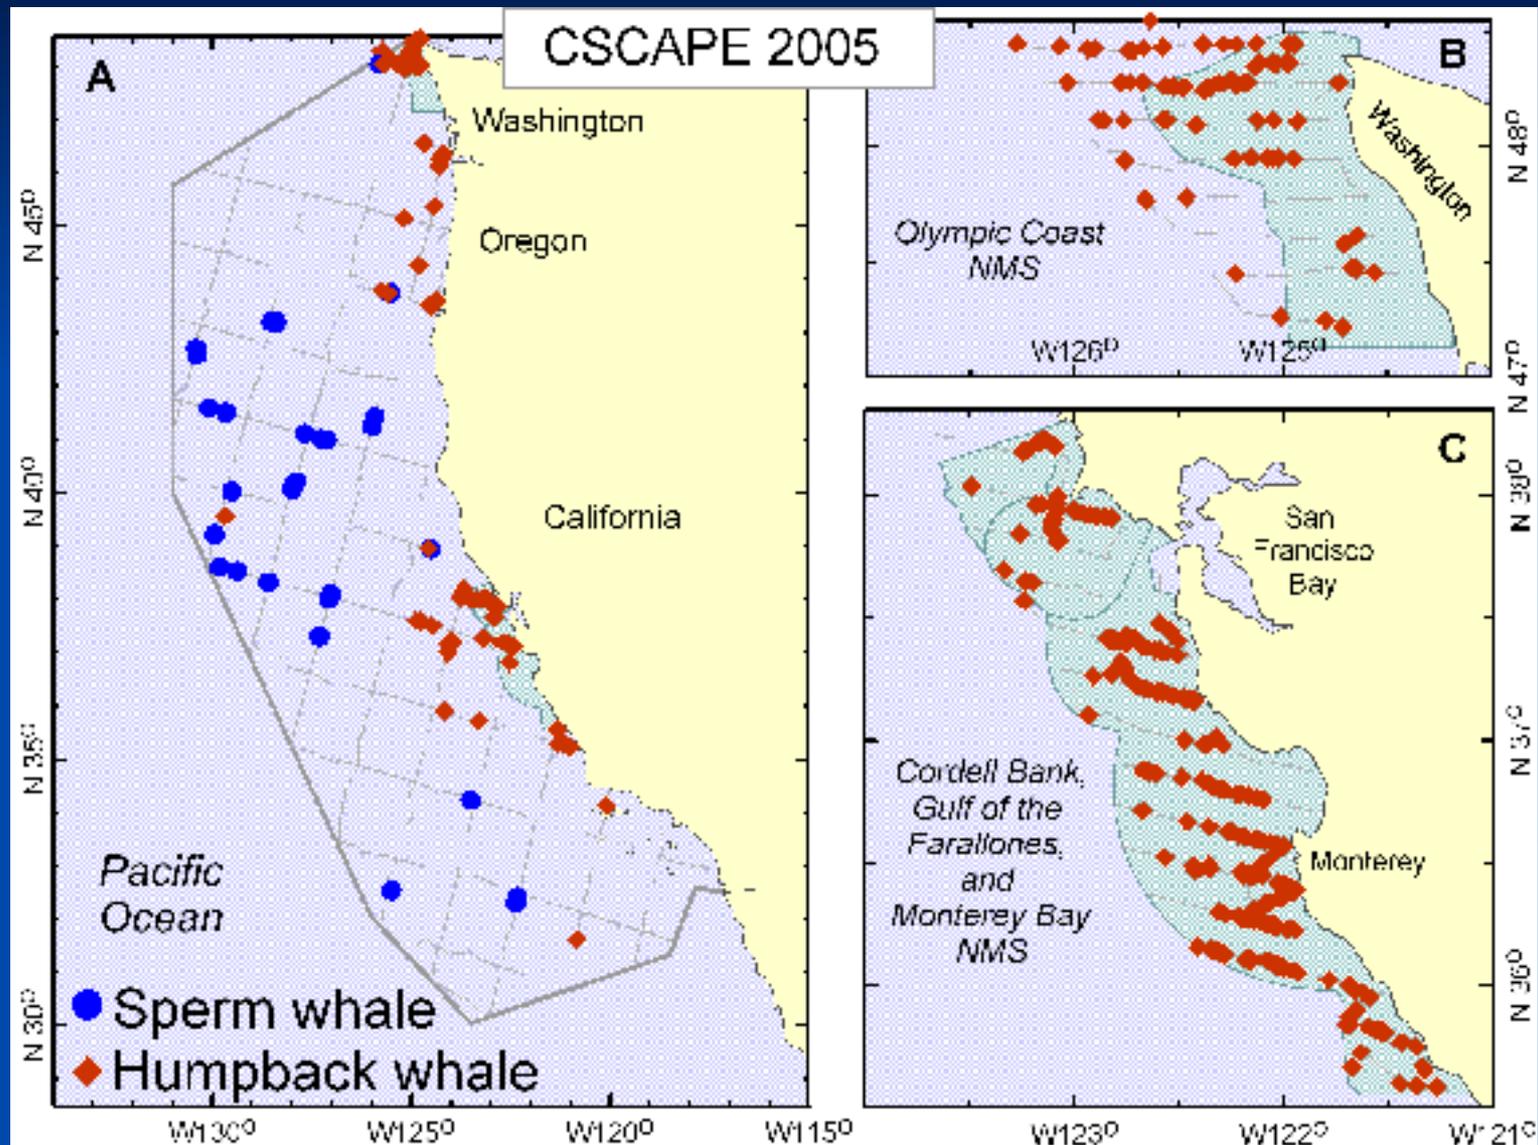

How are they doing?

Humpback Whale

Calambokidis et al.

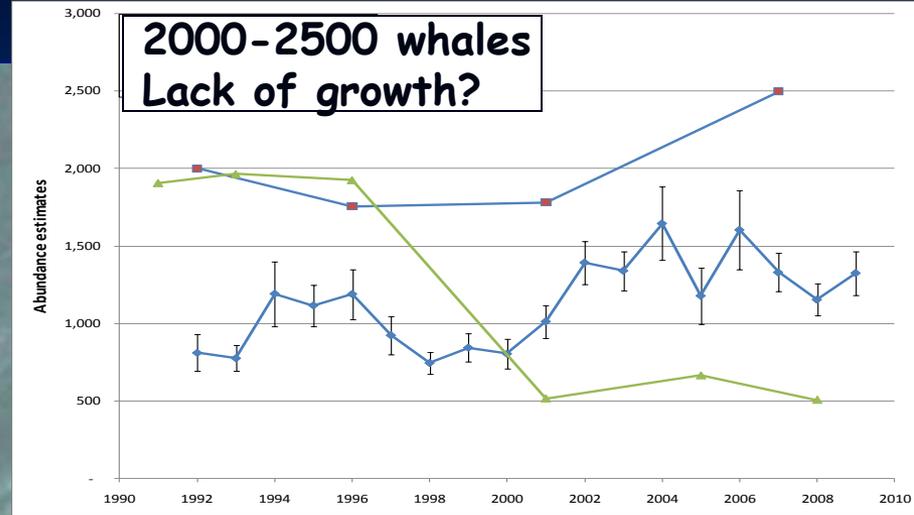

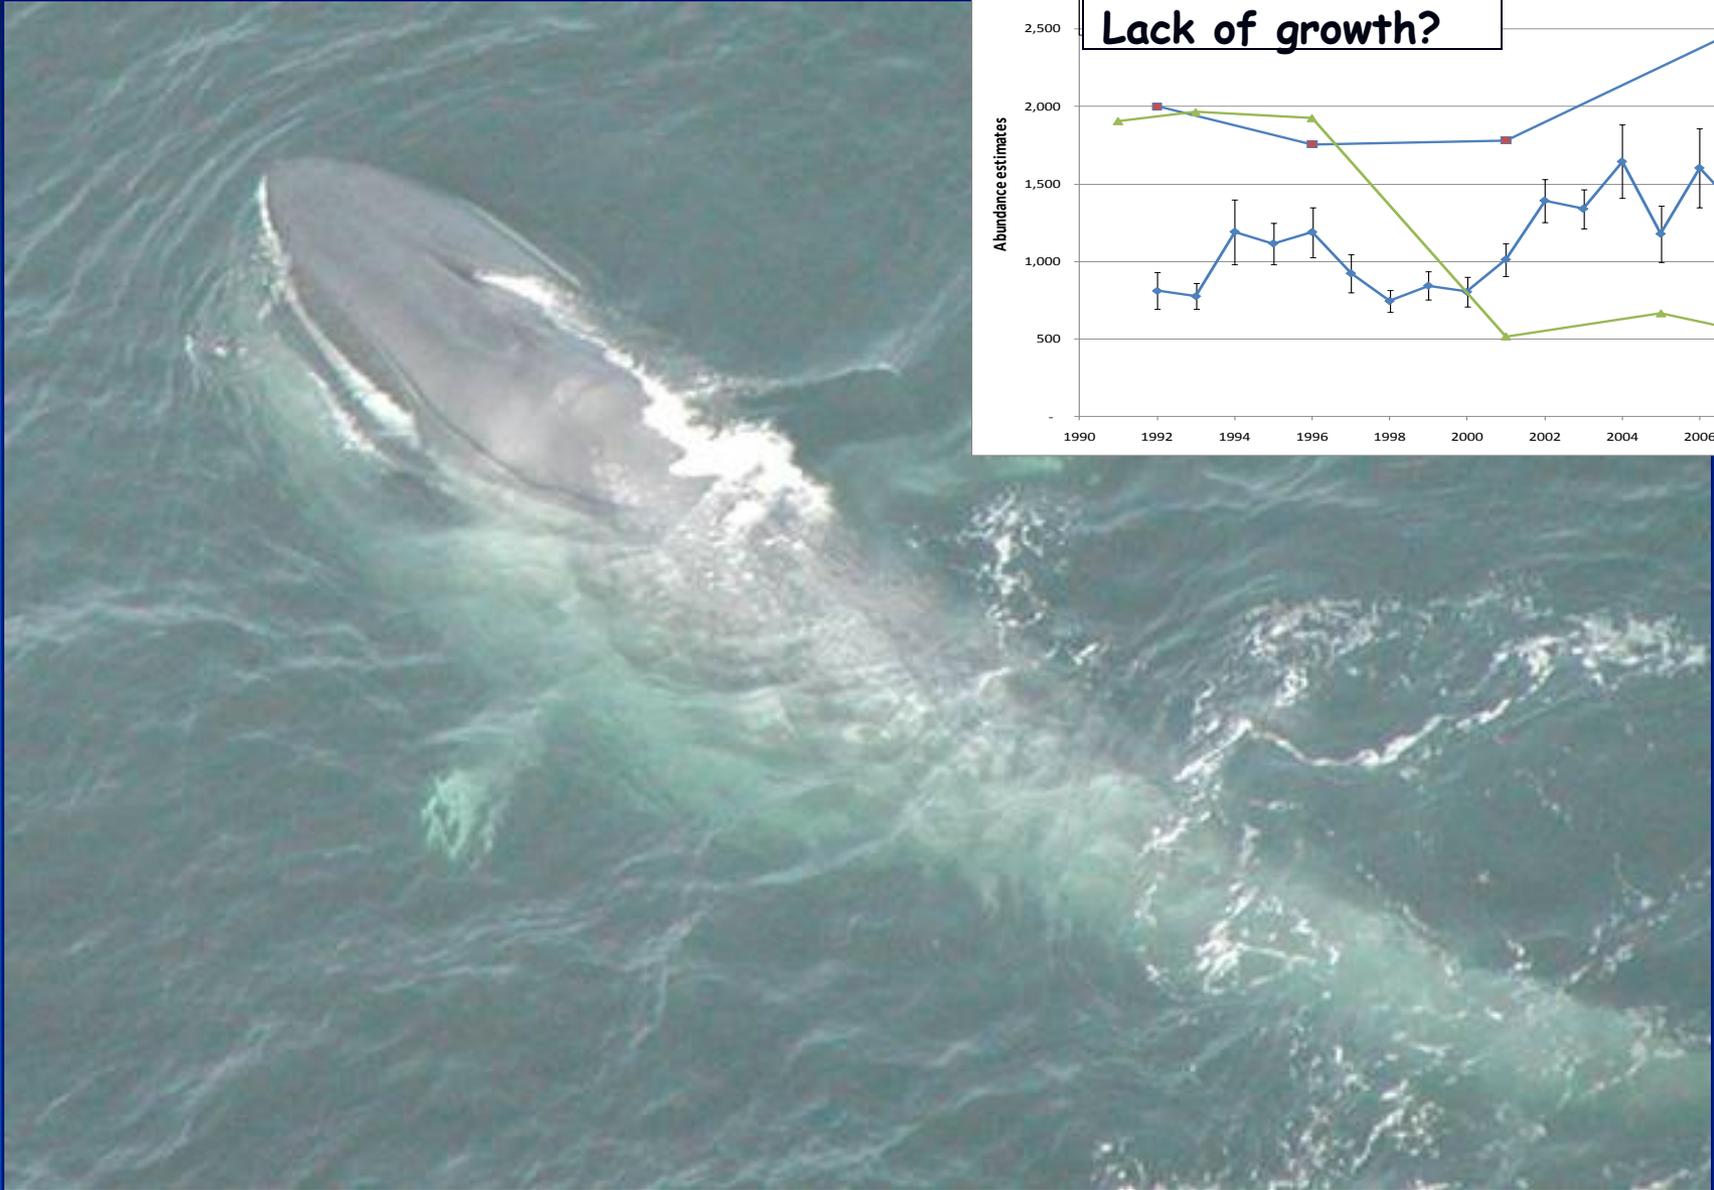

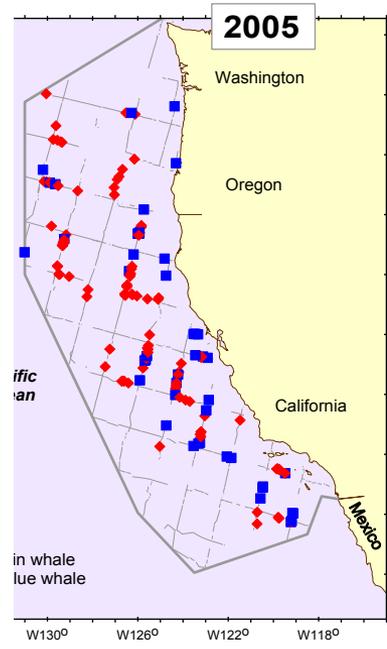

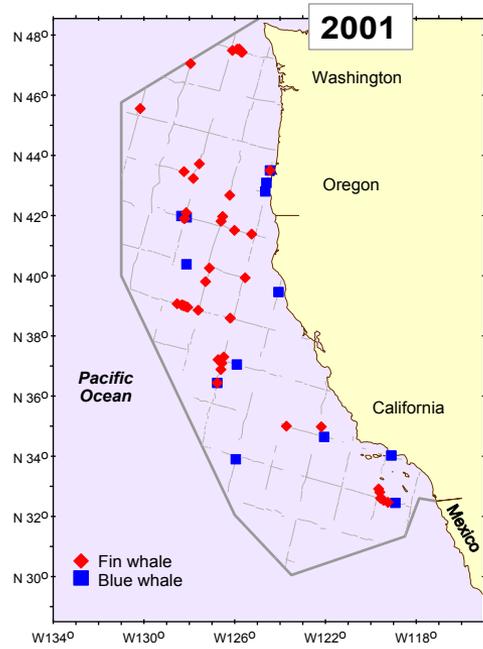

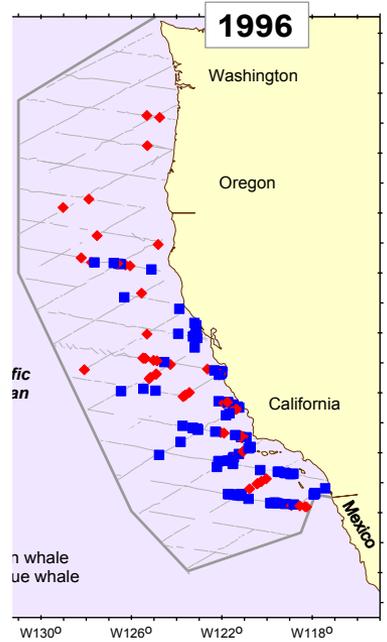

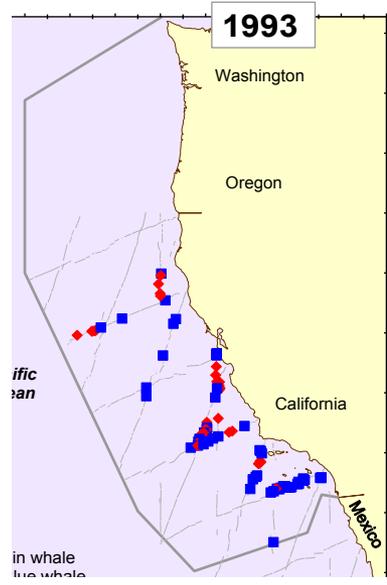

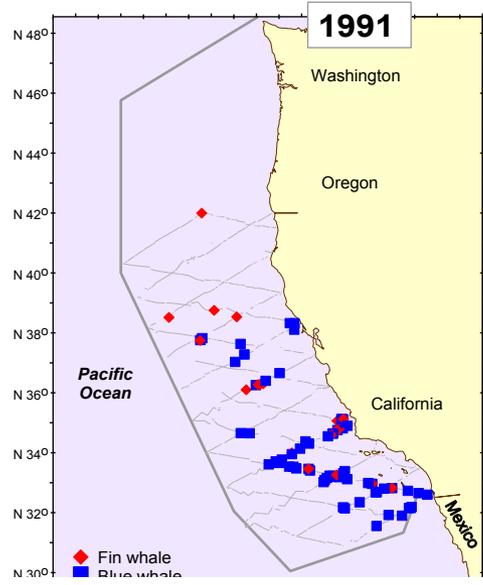

Humpback whales

Blue Whale

Calambokidis et al.

Blue
and fin
whales

Blue Whale

'From wind to whales'

Croll et al. 2005

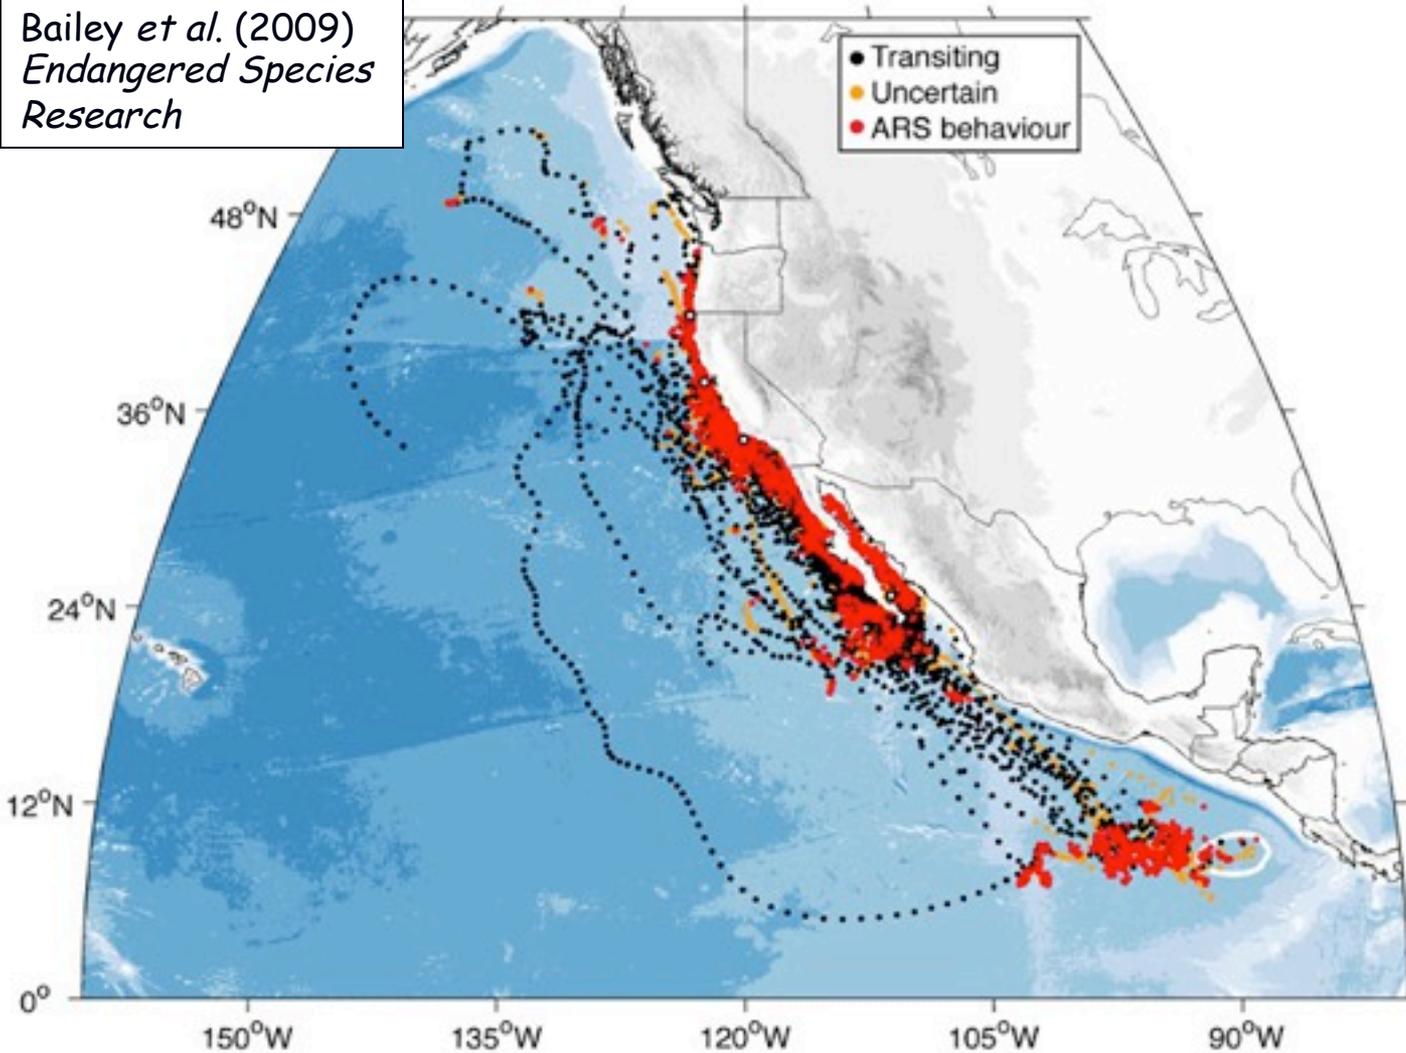

1993-2007 Oregon State University
tagging study: 92 tracks \geq 7 days

*Mate et al. 1999, Mate et al. 2007,
Bailey et al. 2009*

Blue whale behavior in the NE Pacific

Bailey *et al.* (2009)
*Endangered Species
Research*

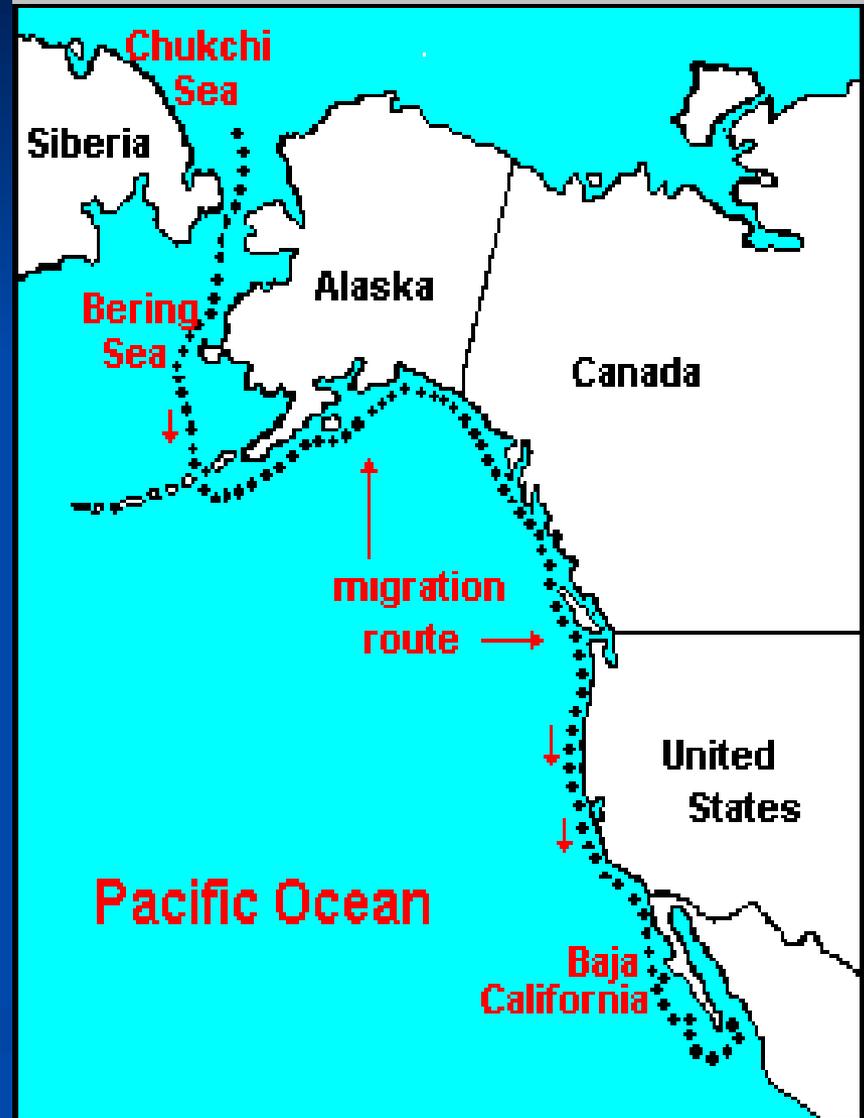

Gray Whale

- Migrate through area each winter/spring en route between Alaska (feeding) and Baja California (breeding)
- ~18,000 whales; recovered from past whaling (delisted)

- ‘Transient’ killer whales prey on females with calves during northbound migration (Mar-May)

Killer Whale

Three distinct ecotypes off California:

'Transient' killer whales:

- Mammal-eaters
- Roam widely but most common in MBNMS when gray whales are here

'Resident' killer whales

- Salmon-eaters
- Summer in inland waterways of WA/BC, move along outer coast during winter

'Offshore' killer whales

- Feed on squid and pelagic fishes
- Roam widely

Distinct based on

- Diet
- Vocal dialects
- Genetics
- Dorsal fin shape
- Lack of association

Dall's porpoise

Pacific white-sided dolphin

Risso's dolphin

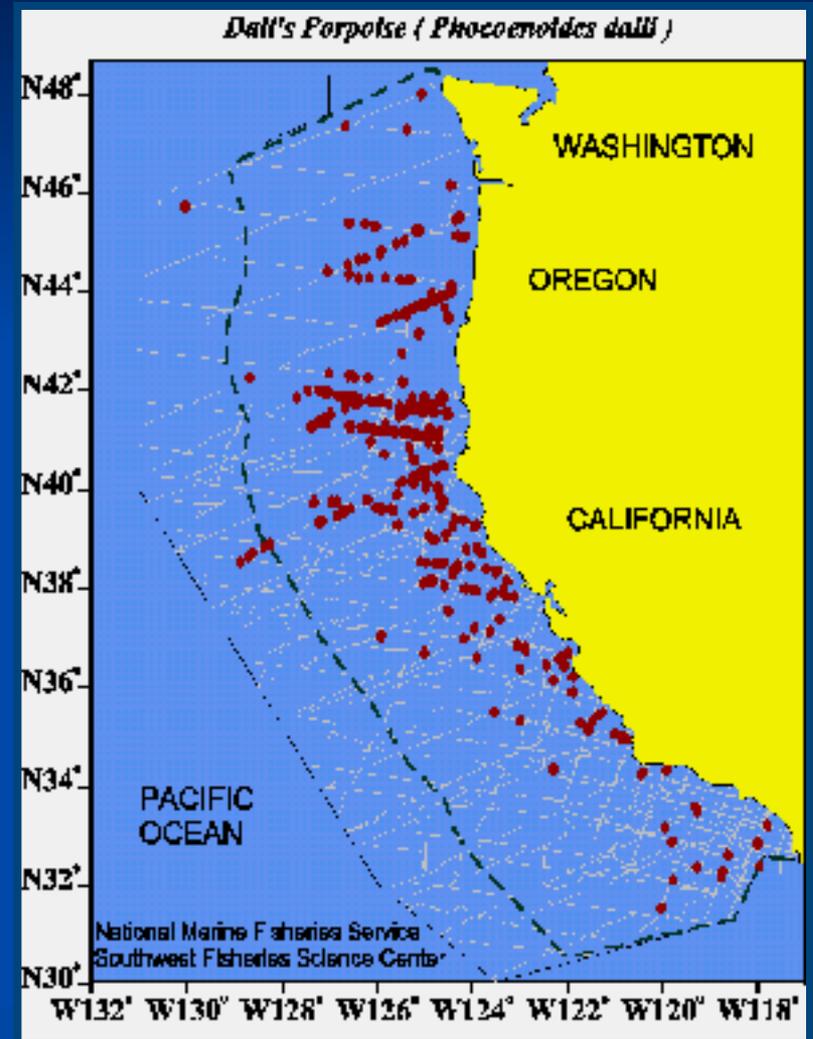

Northern right whale dolphin

Dall's porpoise, *Phocoenoides dalli*

- Shelf, slope and sometimes) beyond
- Cooler water <17°C
- Upwelling-modified
- Seasonal movements
- Interannual variability
- Prey: mesopelagic fish, squid (varied)

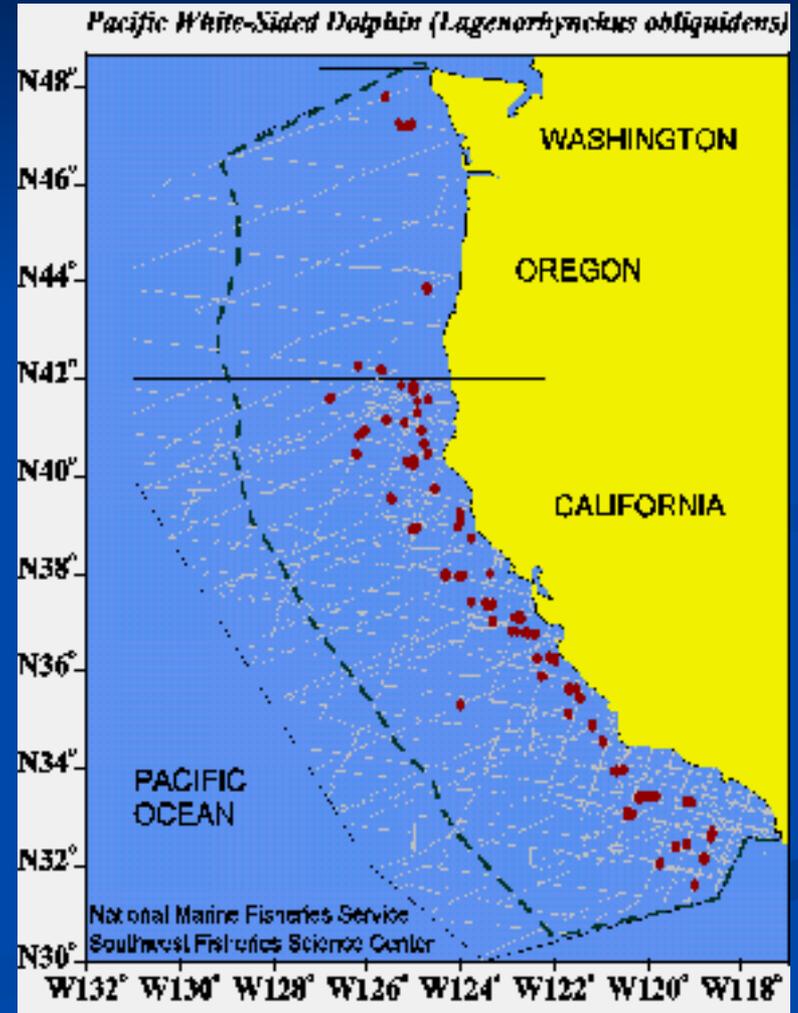

Source: NMFS, Southwest Fisheries Science Center

Pacific White-sided Dolphins, *Lagenorhynchus obliquidens*

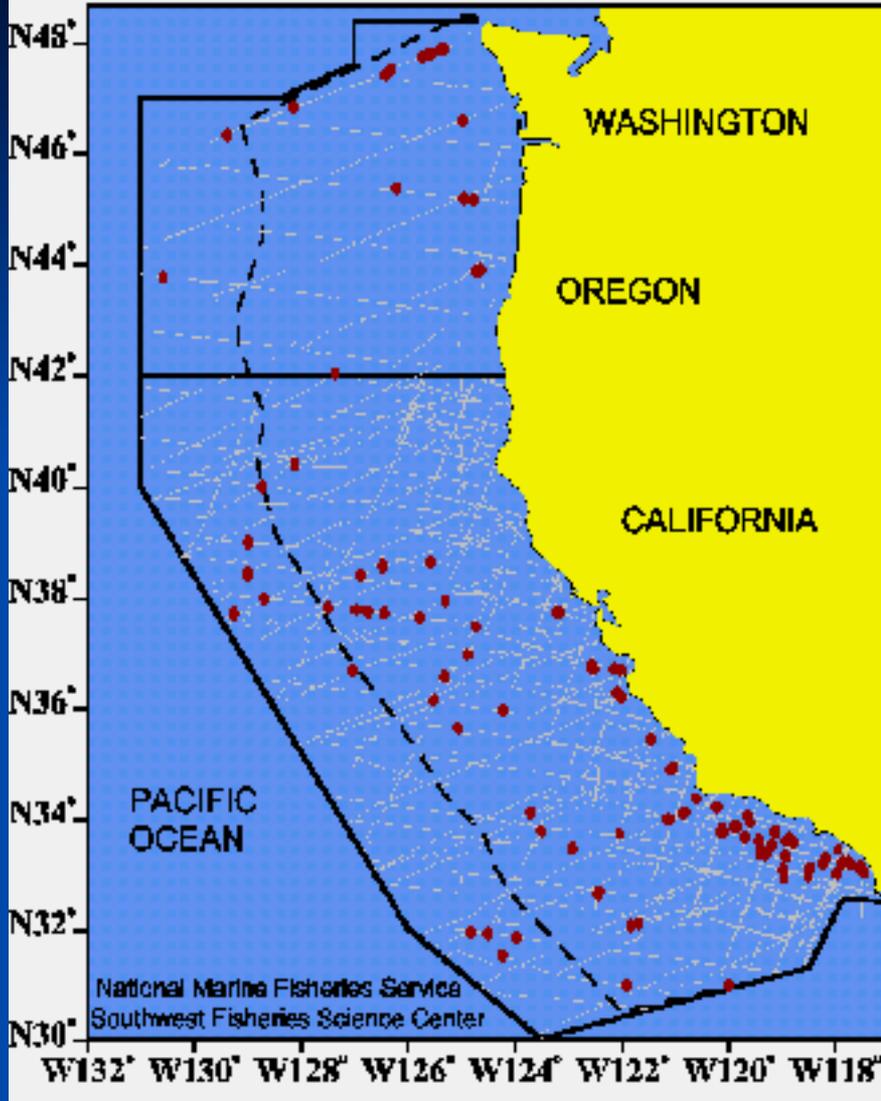

- Shelf and slope
- Cooler water
- Seasonal movements
- Interannual variability
- Prey: squid, fish (varied)

Source: NMFS, Southwest Fisheries Science Center

Risso's Dolphin (Grampus griseus)

Risso's Dolphins *Grampus griseus*

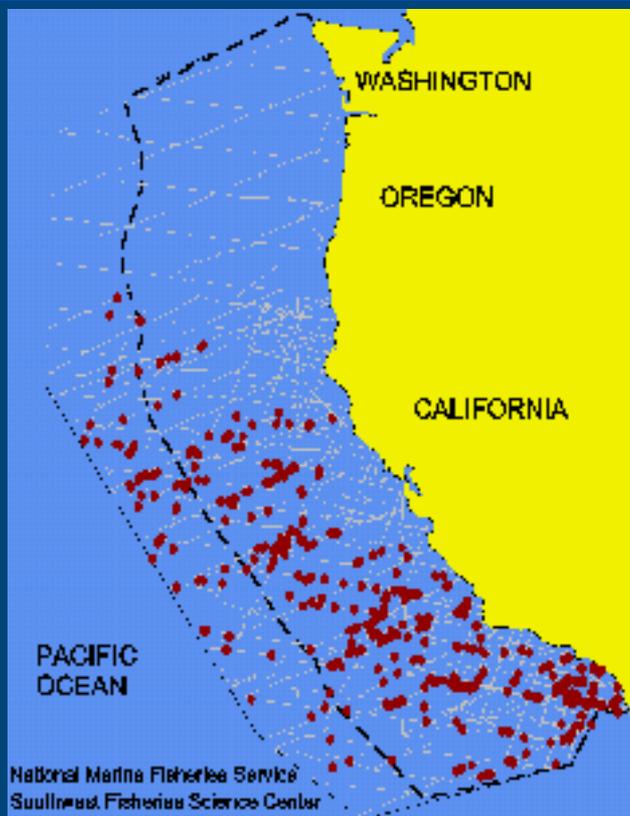

- Shelf, complex bathymetry, deep, *not slope?*
- Warmer waters
- Seasonal movements
- Interannual variability
- **Prey: squid**

Source: NMFS, Southwest Fisheries Science Center

Short-beaked common dolphin

Long-beaked common dolphin

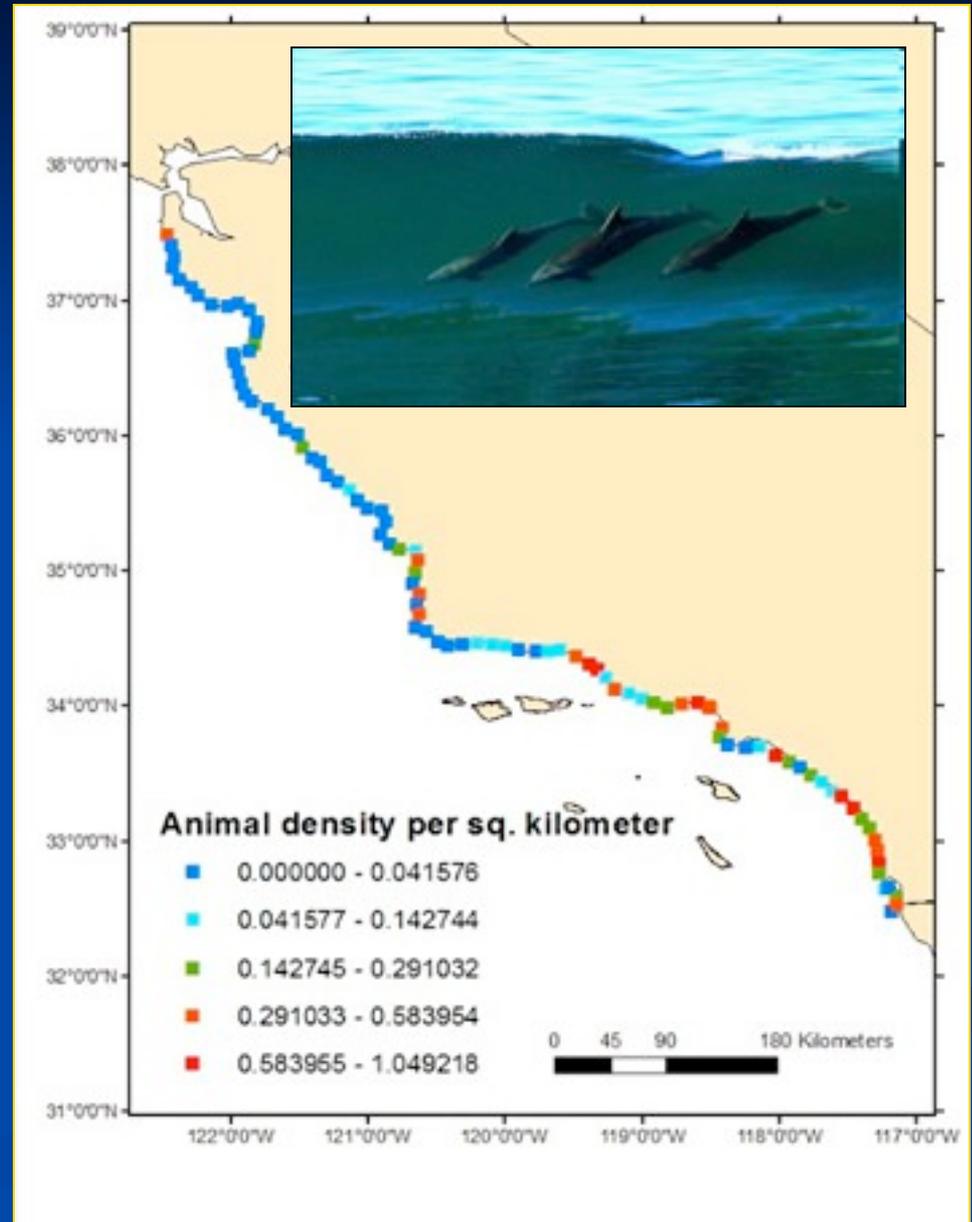

- Very abundant
- Seasonal movements
- Interannual distribution shifts
- Prey: fish, squid (varied)

Bottlenose dolphin

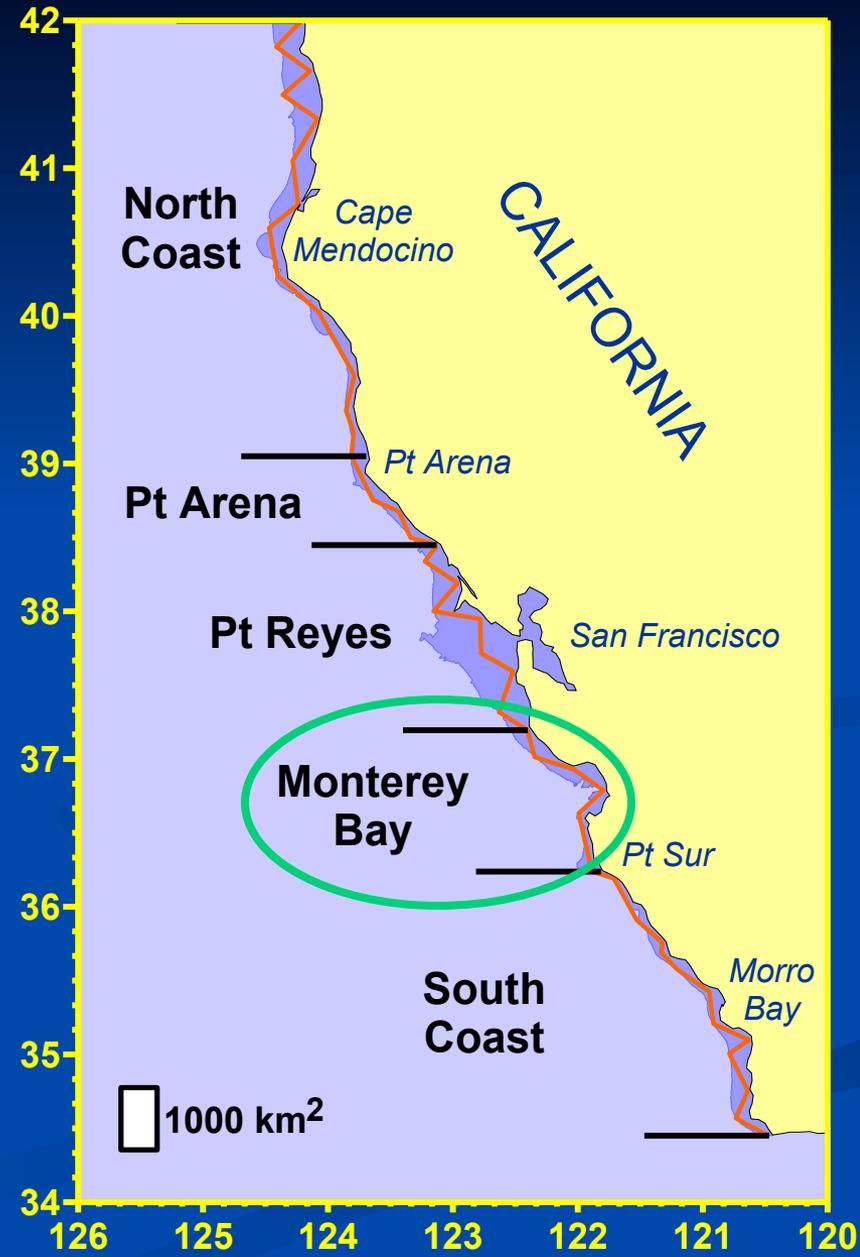

- Live within ~1km of shore
- Range from San Francisco to Ensenada, Mexico
- 1982 El Niño range expansion
- Recently involved in 'porpicide' in Monterey Bay

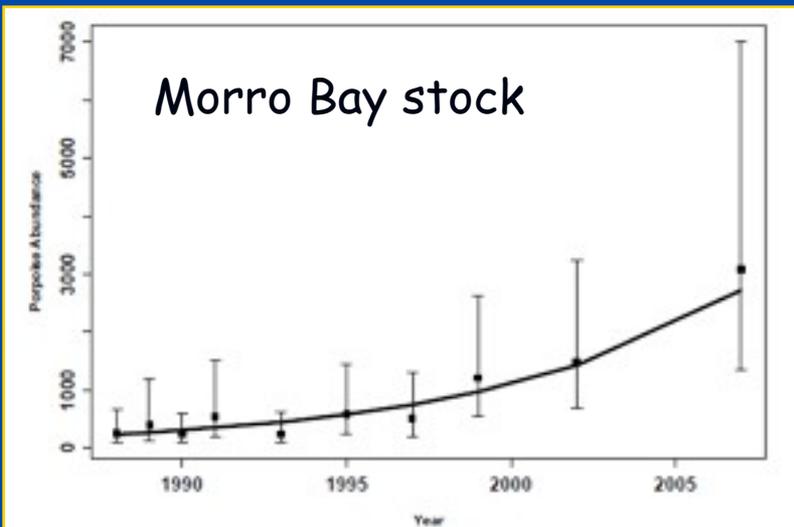

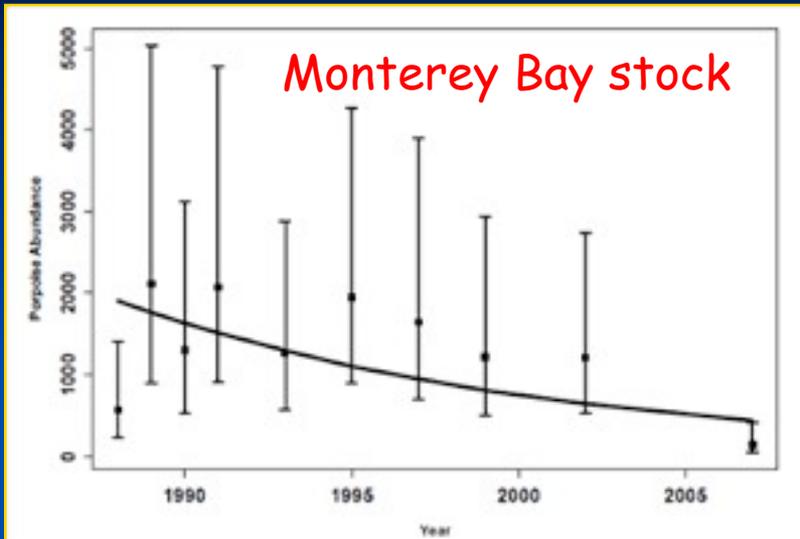

Harbor porpoise

- Nearshore waters only
 - Continuous range N of Pt Conception, but distinct, localized populations
 - **Prey: anchovy, herring, cusk eels, squid, misc.**
- Significant past impacts from gillnet bycatch

Harbor porpoise trends

Fine-scale surveys in Monterey Bay

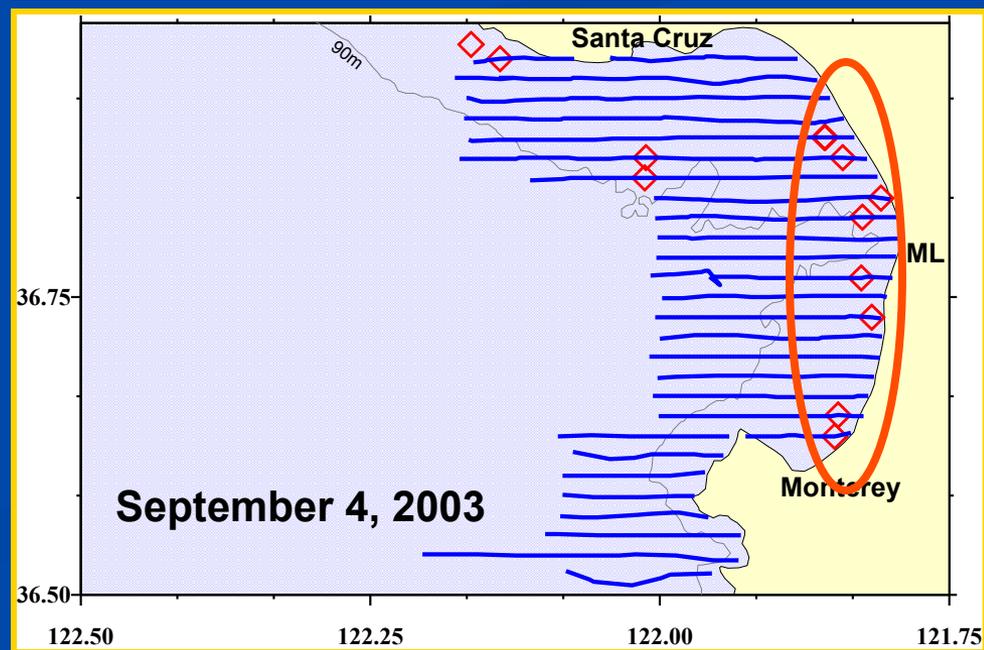

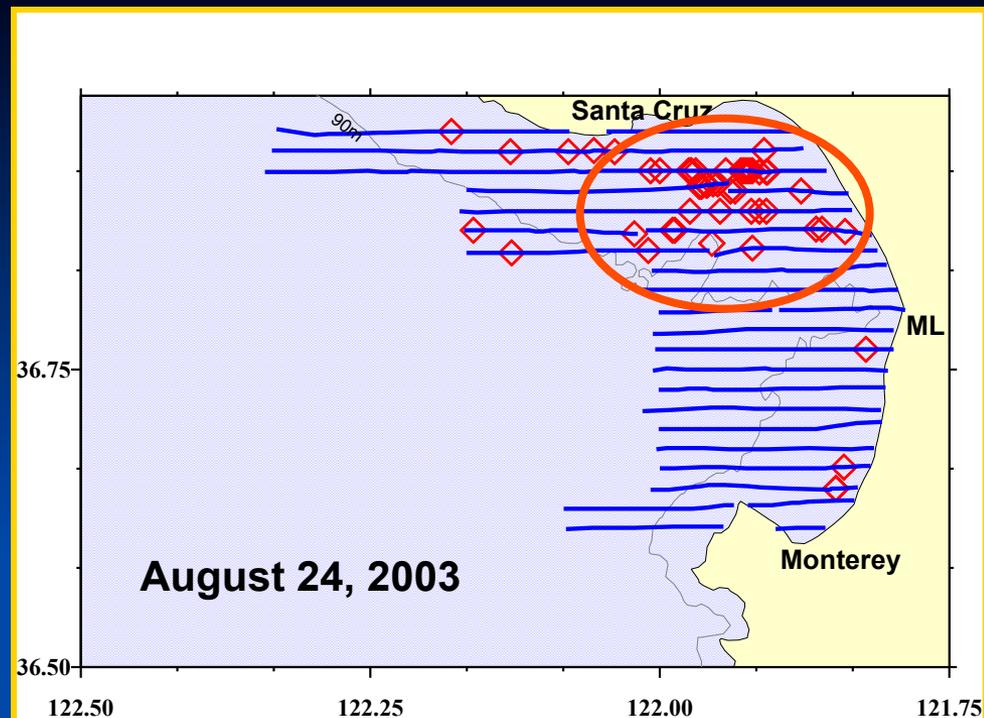

Shifts in porpoise distribution and patchiness...

...affect monitoring efforts

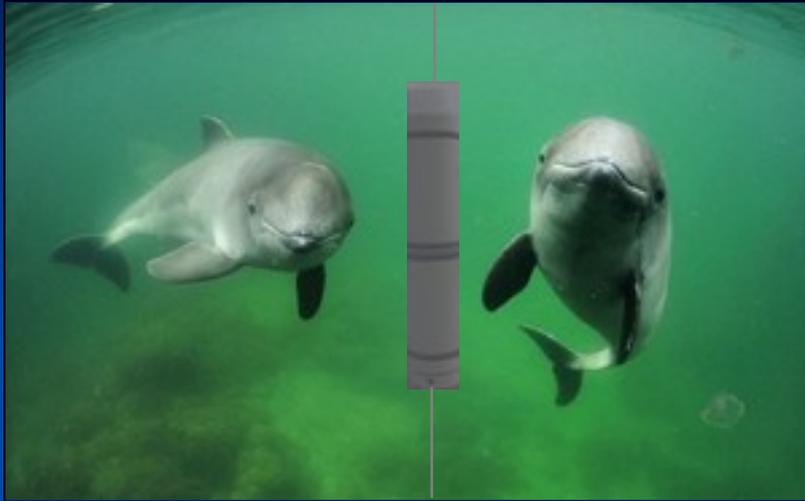

...relate to oceanography

Can we understand their movement patterns?

New study to monitor porpoises acoustically using CPOD

PILOT STUDY: Acoustic monitoring and habitat use of harbor porpoise in Monterey Bay

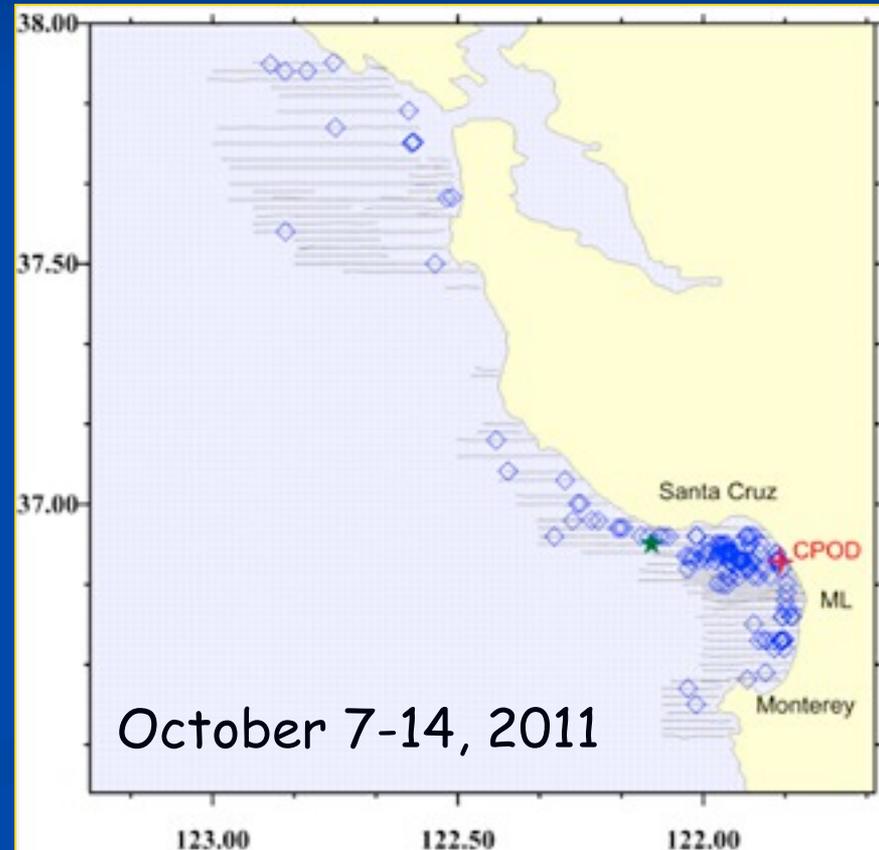

Collaboration between: Karin Forney, Scott Benson, Eiren Jacobson (NOAA) and Jim Harvey (MLML)

Coordinated study:

- CPOD (porpoise click detector) moored off Sunset State Beach
- Aerial surveys
- Cliff-top observations

Ultimate goals:

- Monitor abundance and trends
- Link movements with oceanography and climate

Beaked whales

- Difficult to observe and identify at sea
- New species still being described (e.g. *M. perrini*)
- Highly sensitive to sound
- Deaths caused by naval/ seismic activities worldwide

Cuvier's beaked whale

~ 6 species of *Mesoplodon*

Baird's beaked whale

Emerging Issues - Minimizing risk to cetaceans

Potential Threats:

Ship strikes

Fishing gear entanglements

Naval/seismic activities

Coastal marine development

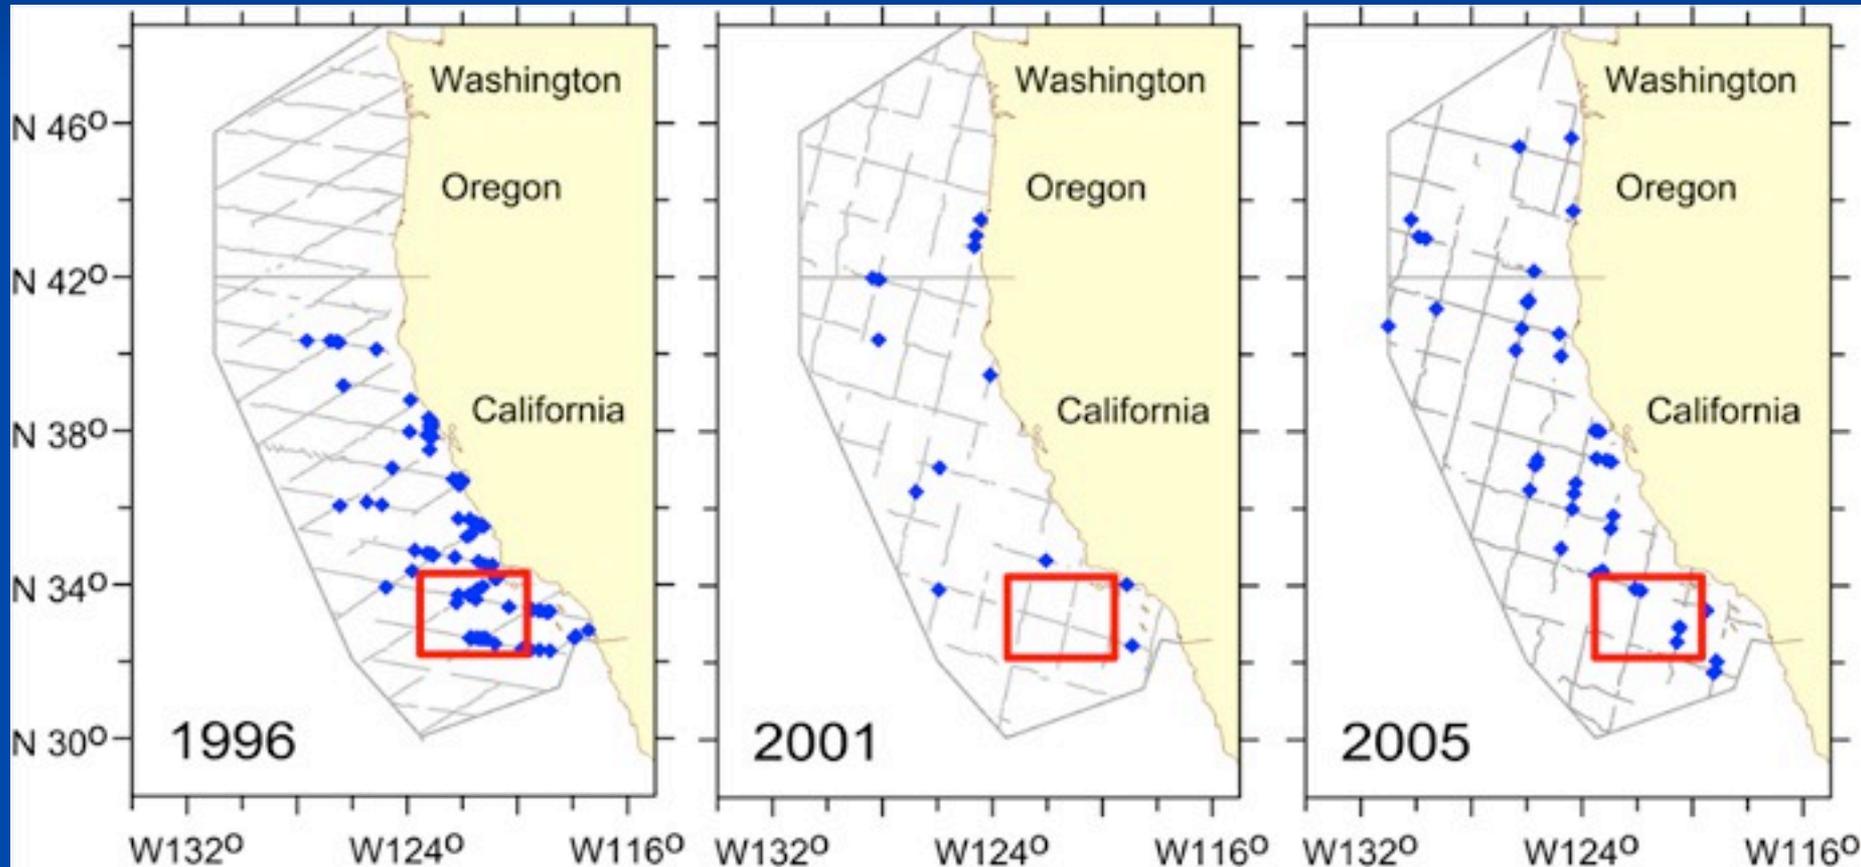

Cetacean distributions are dynamic

Blue whale

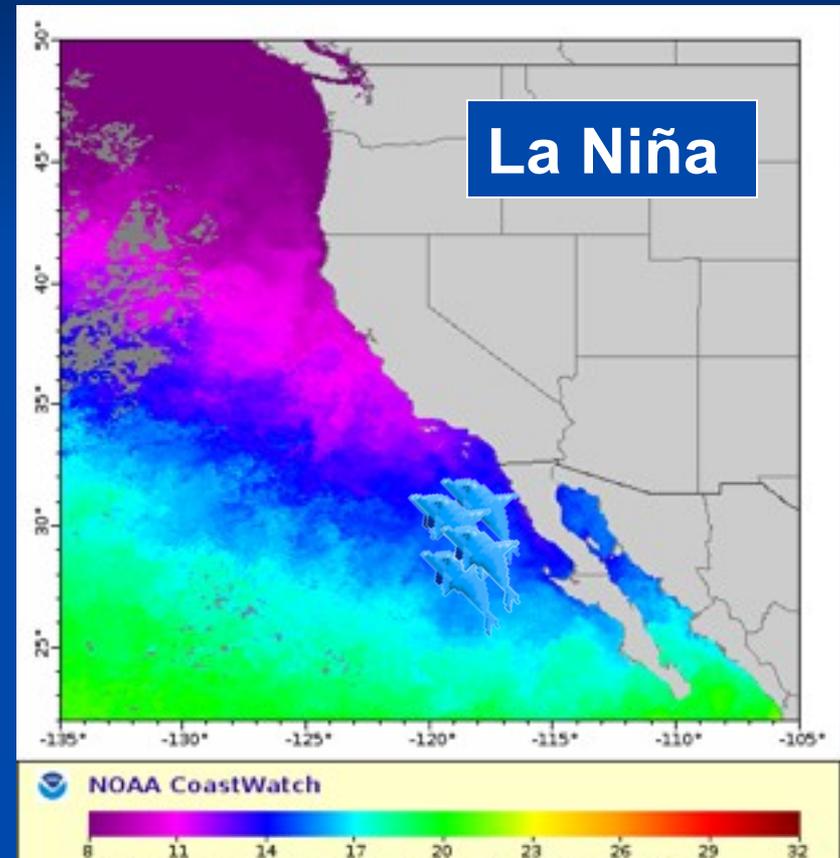

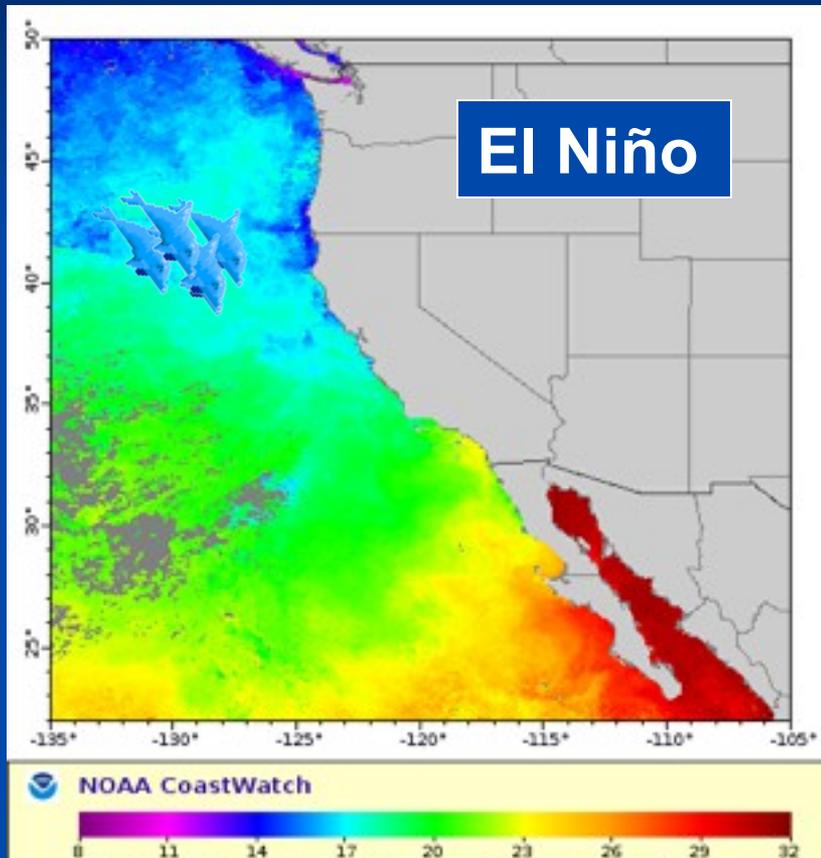

Blue whale

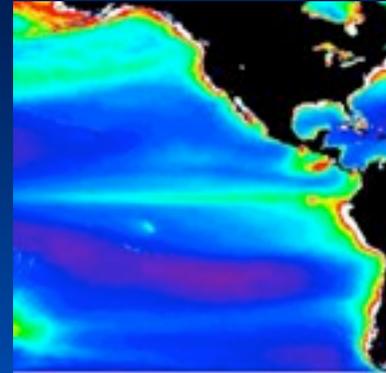

Environmental variability

Marine mammals are highly mobile; distributions change on seasonal, interannual and decadal time scales

Challenge: How can we predict high/low density areas to minimize risks to cetaceans?

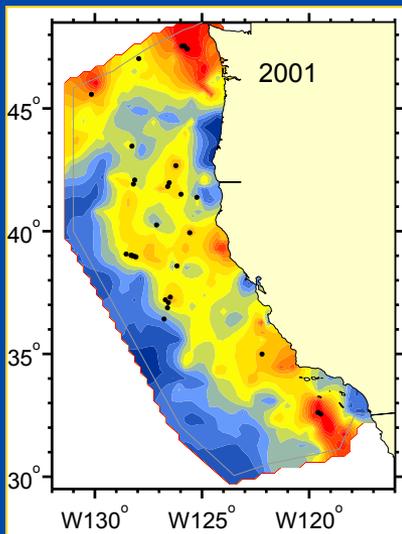

HABITAT-BASED DENSITY MODELS

Marine Mammal Survey Data

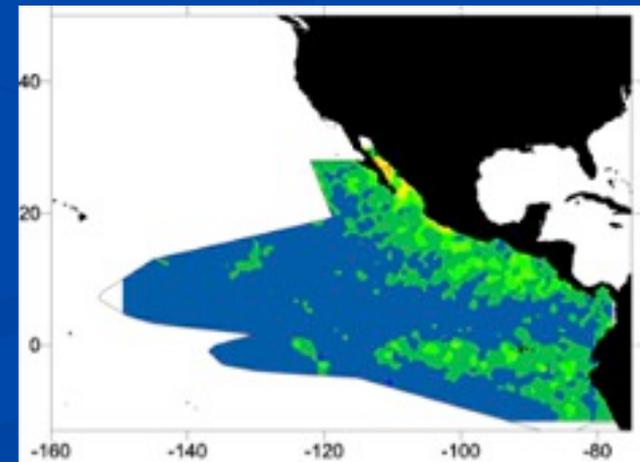

Habitat Data

Statistical models of marine mammal density relative to habitat variables

California Current Ecosystem

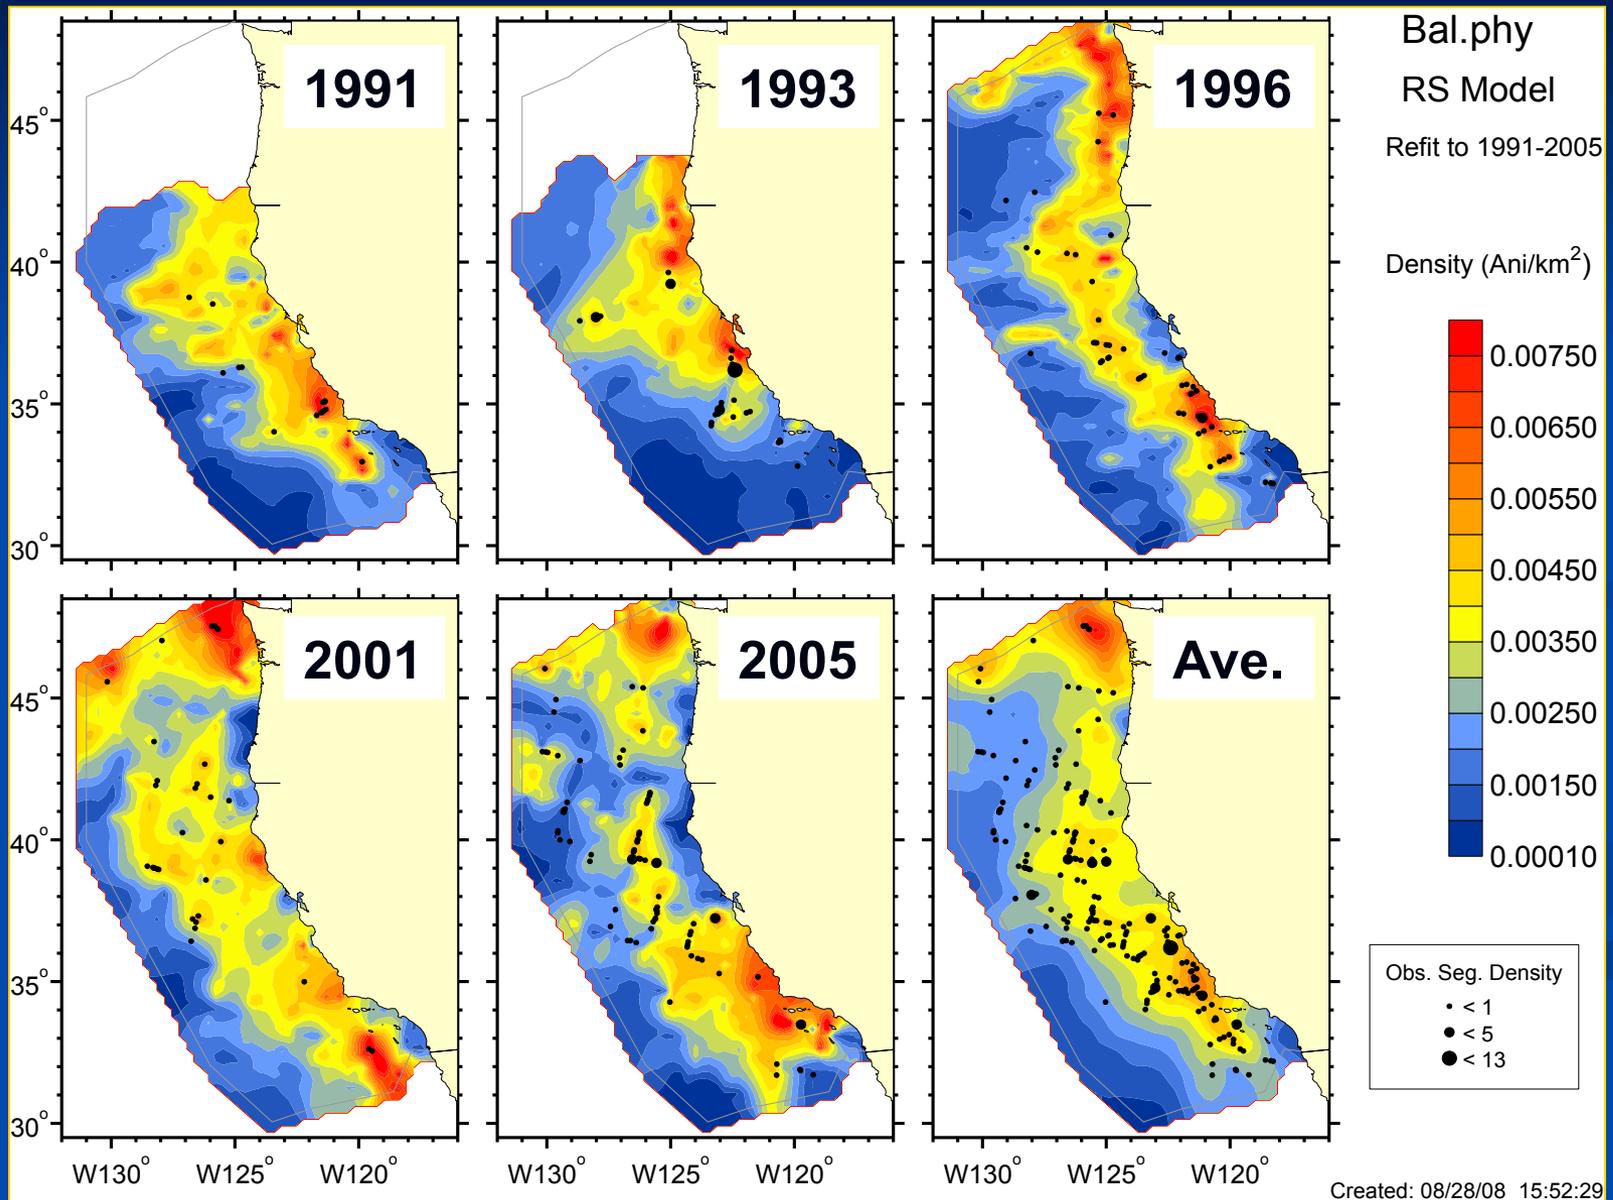

Eastern Tropical Pacific Ocean

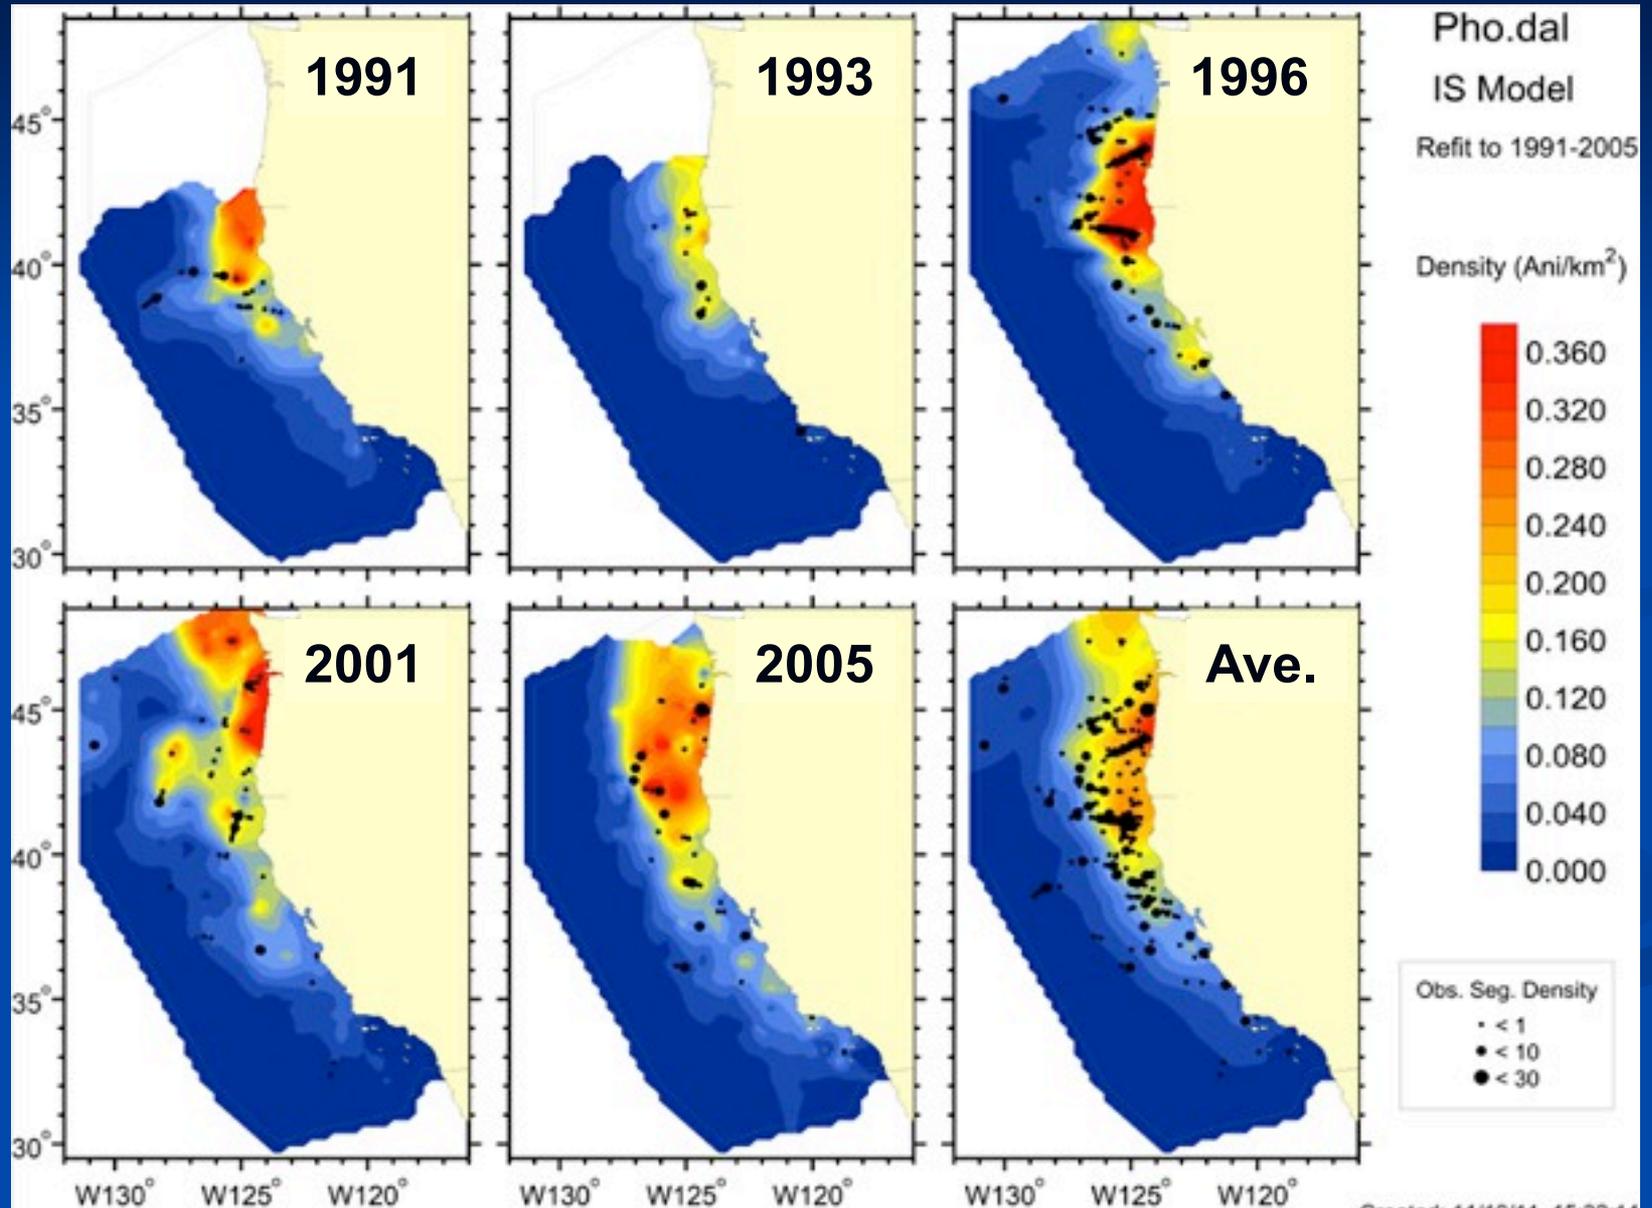

Ferguson et al. 2006, Barlow et al. 2009, Forney et al, in press

Fin whale densities

Key predictor variables Depth, Slope, SST

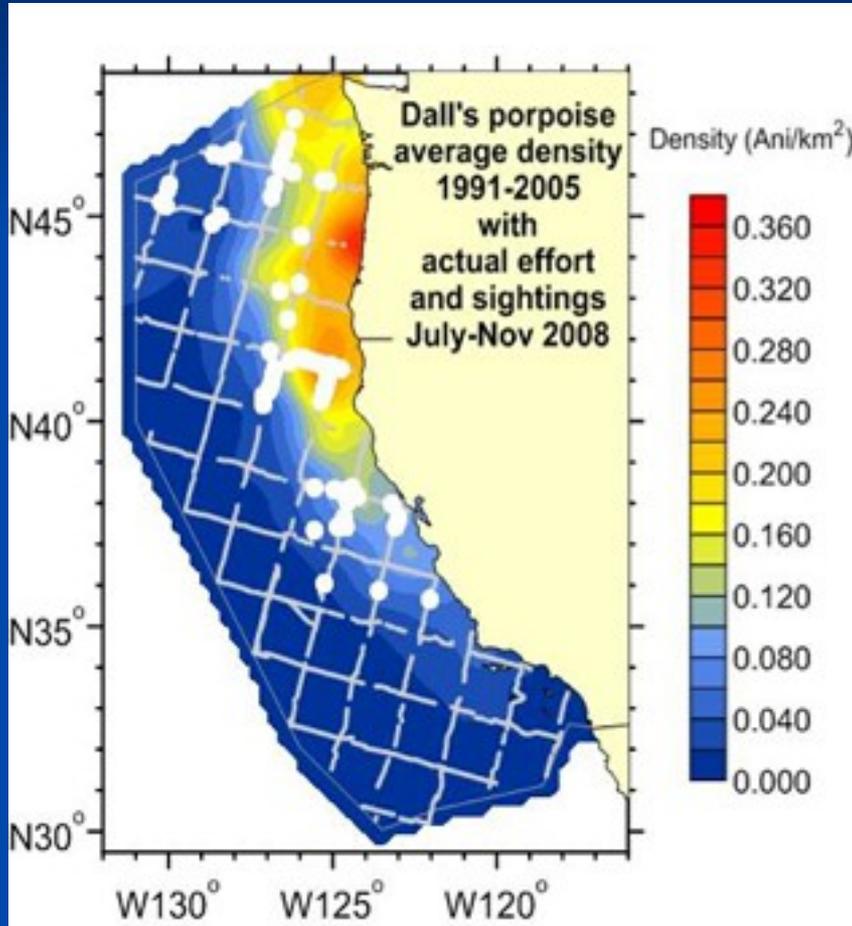

Dall's porpoise densities

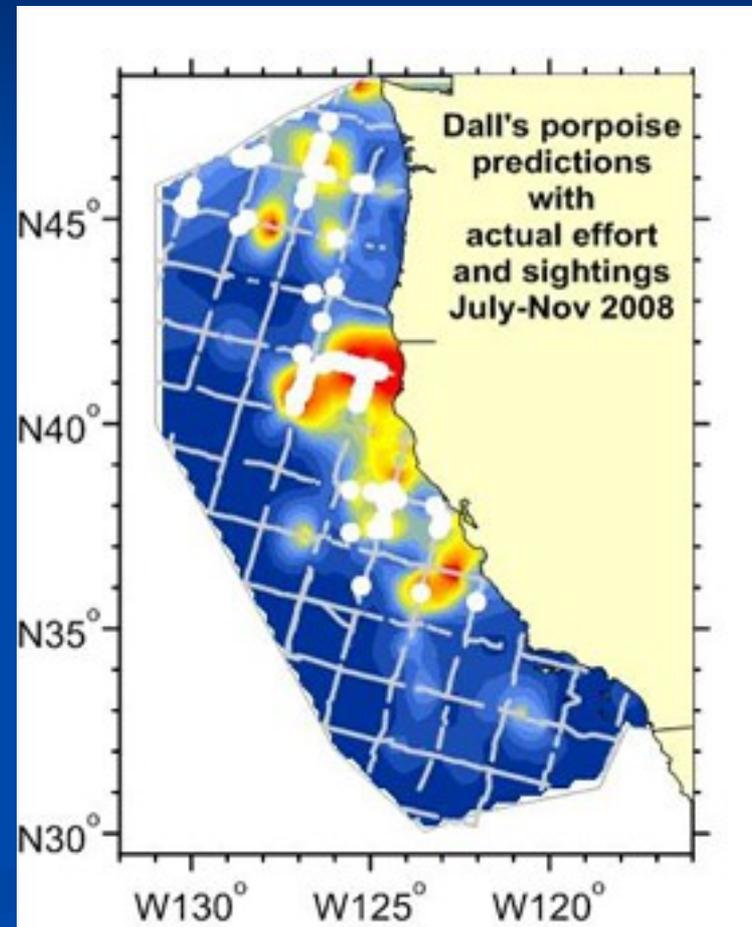

NOWCASTS - using satellite derived data

July - Nov 2008 Dall's porpoise sightings

1991-2005 Average model

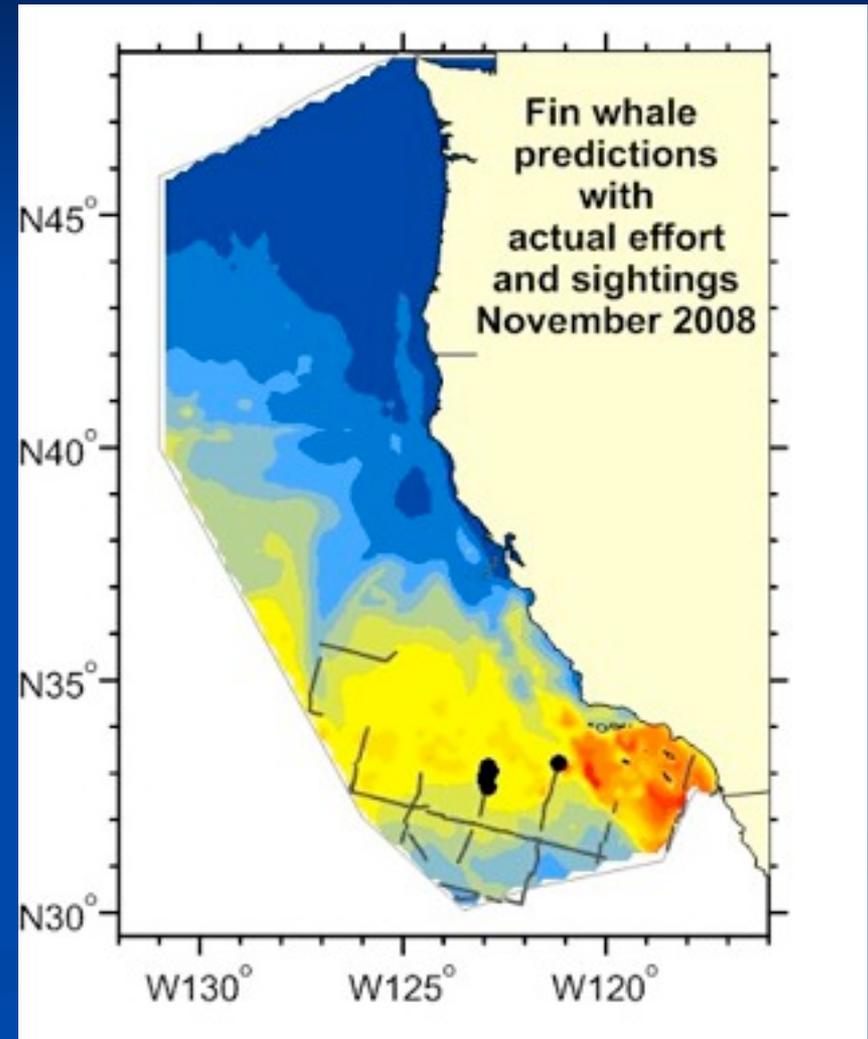

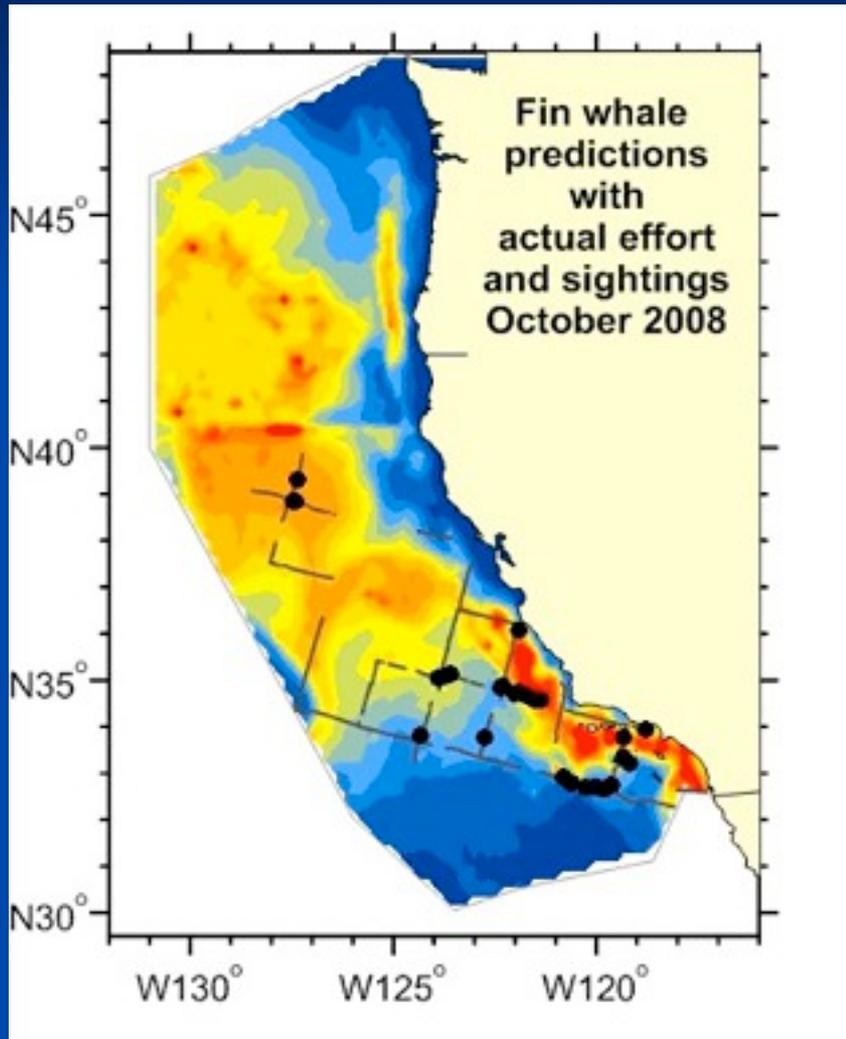

NOWCAST model

Becker, Forney, Foley, Barlow (in press, Endangered Species Research)

FORECASTS - using ocean circulation models

July 2008 predictions for Oct/Nov 2008

Conclusions

- We live in an amazing place!
- MBNMS waters are important habitat for many, diverse cetacean species
- Cetaceans, esp. coastal species, can be impacted by a variety of anthropogenic activities
- Sentinels of ocean health within the MBNMS

Thanks!

Any questions?
